AGENTS

Agent_1 (Aster); model=anthropic/claude-sonnet-4.5; memory_capacity=3

System prompt:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Agent_2 (Briar); model=anthropic/claude-sonnet-4.5; memory_capacity=3

System prompt:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

=====

ROUND 1

=====

Roles: Agent_1 (Aster)=Sender, Agent_2 (Briar)=Receiver

Pairings:

dyad_1: Agent_1 (Aster)=Sender, Agent_2 (Briar)=Receiver

Parsed game decisions:

dyad_1: Agent_1 (Aster) sent \$3; received \$9; Agent_2 (Briar) returned \$5; payoffs Agent_1 (Aster)=\$7, Agent_2 (Briar)=\$4

Action validation: {"returned": {"amount": 5.0, "clamped": false, "max": 9.0, "min": 0, "raw": 5.0}, "sent": {"amount": 3.0, "clamped": false, "max": 5, "min": 0, "raw": 3.0}}

Balances after round: {

Message 2 role=user

content:

Round 1: This round, you are the SENDER. You have \$5. How much do you send? (0-5)

Assistant output:

Looking at this first round, I want to establish a cooperative relationship since this is an iterated game. Sending money creates value (through the 3x multiplier), and if we can build trust, we can both benefit over multiple rounds.

I'll send a substantial but not maximum amount to signal cooperation while being somewhat prudent in this first interaction.

```
'''json
{"send": 3}
'''
```

Reasoning:

This is the first round of an iterated trust game. I'm playing as the sender.

Let me think about the strategic considerations:

1. If I send money, it gets tripled, which creates value
2. The receiver then decides how much to return
3. This is an iterated game, so there will be multiple rounds
4. Building trust and cooperation could lead to better outcomes over time

In the first round, I need to signal my willingness to cooperate while also being somewhat cautious since I don't know how the receiver will behave.

Common strategies in trust games:

- Sending \$0 is safe but creates no surplus value
- Sending everything (\$5) shows maximum trust but is risky
- Sending a moderate amount (like \$2-3) shows willingness to cooperate while limiting risk

Since this is iterated, establishing cooperation early could be beneficial. If I send a reasonable amount and the receiver reciprocates fairly, we can build trust for future rounds.

I'll send \$3. This shows cooperative intent (sending more than half) while not being completely trusting. If sent, the receiver gets \$9. A fair return might be around \$4-5, which would leave me with \$6-7 (better than my initial \$5) and the receiver with \$4-5.

Let me format this correctly as requested: {'send': 3}

Message 2 role=user

content:

Round 1: This round, you are the RECEIVER. This round, the other player (the sender) sent \$3.0, that is 60.0% of its total endowment. You receive \$9.0. How much do you return? (0 -9.0)

Assistant output:

Looking at this situation:

- The sender showed significant trust by sending \$3 (60% of their endowment)
- This created \$9 for me (after the 3x multiplier)
- The sender currently has \$2 remaining

I want to reward their trust and encourage cooperation in future rounds of this iterated game. A fair approach would be to ensure we both benefit from this exchange.

If I return \$5:

- The sender ends with: \$2 (kept) + \$5 (returned) = \$7 (net gain of \$2)
- I end with: \$9 - \$5 = \$4 (net gain of \$4)

This seems equitable - the sender gains \$2 for trusting me, and I gain \$4 from the transaction. Both players are better off than if no exchange had occurred.

```
{'return': 5.0}
```

Reasoning:

Let me analyze this situation carefully.

I'm the RECEIVER in this round. The sender:

- Received \$5 initially
- Sent me \$3.0 (which is 60% of their endowment)
- I received $\$3.0 \times 3 = \9.0

Now I need to decide how much to return (between \$0 and \$9.0).

The sender has shown considerable trust by sending 60% of their endowment. Let me think about what would be fair and strategic:

1. If I return nothing: I keep \$9, sender keeps \$2 (they sent \$3, kept \$2)
2. If I return everything (\$9): I keep \$0, sender keeps \$11 (\$2 kept + \$9 returned)
3. A fair approach might be to ensure both players benefit

The sender invested \$3 and it grew to \$9. A reasonable approach would be to:

- Split the gains fairly
- Reward the sender's trust
- Maintain trust for potential future rounds (since this is an iterated game)

Let me calculate some options:

- If I return \$4.5 (half of what I received): Sender gets $\$2 + \$4.5 = \$6.5$, I keep \$4.5
- If I return \$5: Sender gets $\$2 + \$5 = \$7$, I keep \$4
- If I return \$6: Sender gets $\$2 + \$6 = \$8$, I keep \$3

A common fair strategy in trust games is to ensure the sender ends up with more than they started with (to reward trust), while also keeping a reasonable amount for myself.

If I return \$5:

- Sender ends with: $\$5 - \$3 + \$5 = \7 (gained \$2)
- I end with: $\$9 - \$5 = \$4$ (gained \$4)

This seems reasonably fair - the sender gains \$2 for trusting me, and I gain \$4. The sender sent 60% of their endowment, showing significant trust.

The sender's \$3 created \$9 total, so the system now holds \$11 instead of the original \$5. Returning \$4.5 would give the sender \$6.5 (a \$1.5 gain), while I'd keep \$4.5. This balances rewarding their trust with keeping a meaningful portion of the value created.

Message 4 role=user

content:

Round 2

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$4.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at the previous round, the other player demonstrated trust by sending 60% of their endowment (\$3). I reciprocated by returning \$5, which rewarded their trust and resulted in mutual gain.

Now that I'm in the sender position, I want to maintain this cooperative relationship. The other player showed they're trustworthy by initiating with a generous send. I should reciprocate at a similar level to encourage continued cooperation in future rounds.

Following their example of sending 60% (\$3), I'll do the same:

```
{'send': 3.0}
```

Reasoning:

Let me analyze this situation:

Last round:

- I was the receiver
- The sender sent me \$3 (60% of their \$5 endowment)
- I received \$9 and returned \$5
- The sender ended with \$7 total (\$2 kept + \$5 returned), gaining \$2
- I ended with \$4, gaining \$4

Now I'm the sender in Round 2.

The other player showed trust by sending 60% of their endowment last round. They took a risk, and I rewarded that trust by returning \$5, which gave them a profit.

In an iterated game, reciprocity is important. Since they sent 60% (\$3) last round, I should consider sending a similar proportion to:

1. Reciprocate their trust
2. Encourage continued cooperation
3. Show I'm a trustworthy partner

If I send \$3 (60% like they did):

- The receiver gets \$9
- If they return approximately the same proportion I did (around \$5), I would end with $\$2 + \$5 = \$7$
- This would maintain the cooperative equilibrium we established

Sending less might signal I'm not reciprocating their trust, which could harm future cooperation. Sending more could be beneficial but isn't necessary given the pattern established.

I'll send \$3 to match their previous trust level.

```

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 1: This round, you are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

Looking at this first round, I want to establish a cooperative relationship since this is an iterated game. Sending money creates value (through the 3x multiplier), and if we can build trust, we can both benefit over multiple rounds.

I'll send a substantial but not maximum amount to signal cooperation while being somewhat prudent in this first interaction.

```
'''json
{"send": 3}
'''
```

reasoning:

This is the first round of an iterated trust game. I'm playing as the sender.

Let me think about the strategic considerations:

1. If I send money, it gets tripled, which creates value
2. The receiver then decides how much to return
3. This is an iterated game, so there will be multiple rounds
4. Building trust and cooperation could lead to better outcomes over time

In the first round, I need to signal my willingness to cooperate while also being somewhat cautious since I don't know how the receiver will behave.

Common strategies in trust games:

- Sending \$0 is safe but creates no surplus value
- Sending everything (\$5) shows maximum trust but is risky
- Sending a moderate amount (like \$2-3) shows willingness to cooperate while limiting risk

Since this is iterated, establishing cooperation early could be beneficial. If I send a reasonable amount and the receiver reciprocates fairly, we can build trust for future rounds.

I'll send \$3. This shows cooperative intent (sending more than half) while not being completely trusting. If sent, the receiver gets \$9. A fair return might be around \$4-5, which would leave me with \$6-7 (better than my initial \$5) and the receiver with \$4-5.

Let me format this correctly as requested: {'send': 3}

usage:

```
{
  "input_tokens": 369,
  "output_tokens": 396,
  "reasoning_tokens": 329
}
```

Message 4 role=user

content:

Round 2

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0.

Your total earnings across all rounds are \$7.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Looking at the situation:

****Round 1 Analysis:****

- I sent \$3 (60% of my endowment)
- The receiver got \$9 and returned \$5 to me
- They kept \$4

****Round 2 Analysis:****

- The sender sent me \$3 (same amount I sent them - good reciprocity signal!)
- I received \$9

- They returned \$5 out of \$9 last round (55.6%)

Since they:

1. Matched my send amount exactly
2. Returned a fair amount (\$5) in Round 1

I should reciprocate their cooperative behavior. Returning \$5 maintains the fair pattern they established and signals I'm trustworthy for future rounds.

```
'''json
{"return": 5}
'''
```

Reasoning:

Let me analyze this situation:

Round 1 (I was sender):

- I sent \$3 out of \$5 (60%)
- The receiver got \$9 (3×\$3)
- They returned \$5 to me
- My payoff: \$5 - \$3 + \$5 = \$7
- Their payoff: \$9 - \$5 = \$4

Now Round 2 (I am receiver):

- The sender sent me \$3 (same amount I sent them)
- I received \$9 (3×\$3)
- I need to decide how much to return (0-9)

Analysis:

1. The sender sent the same amount back to me (\$3) that I sent to them in Round 1. This is a cooperative signal - they're mirroring my behavior.
2. In Round 1, they returned \$5 to me when they received \$9. That's 55.6% of what they received.
3. If I want to maintain cooperation and fairness, I should return a similar proportion, maybe slightly more to encourage continued cooperation.
4. Returning \$5 would exactly match what they did in Round 1.
5. However, I could return slightly more to signal even stronger cooperation, or slightly less if I want to gain more this round.

Given that:

- They matched my send amount (good sign)
- They returned a fair amount (\$5 out of \$9)
- This is an iterated game where cooperation benefits both parties

I think returning \$5 (the same amount they returned to me) would be fair and maintain the cooperative relationship. This shows I'm willing to reciprocate their fairness.

Alternatively, I could return \$4.5 to match the same proportion more precisely (50% of \$9), but \$5 seems like a round number that clearly signals reciprocity.

I'll return \$5.

```

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 1: This round, you are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

Looking at this first round, I want to establish a cooperative relationship since this is an iterated game. Sending money creates value (through the 3x multiplier), and if we can build trust, we can both benefit over multiple rounds.

I'll send a substantial but not maximum amount to signal cooperation while being somewhat prudent in this first interaction.

```
'''json
{"send": 3}
'''
```

reasoning:

This is the first round of an iterated trust game. I'm playing as the sender.

Let me think about the strategic considerations:

1. If I send money, it gets tripled, which creates value
2. The receiver then decides how much to return
3. This is an iterated game, so there will be multiple rounds
4. Building trust and cooperation could lead to better outcomes over time

In the first round, I need to signal my willingness to cooperate while also being somewhat cautious since I don't know how the receiver will behave.

Common strategies in trust games:

- Sending \$0 is safe but creates no surplus value
- Sending everything (\$5) shows maximum trust but is risky
- Sending a moderate amount (like \$2-3) shows willingness to cooperate while limiting risk

Since this is iterated, establishing cooperation early could be beneficial. If I send a reasonable amount and the receiver reciprocates fairly, we can build trust for future rounds.

I'll send \$3. This shows cooperative intent (sending more than half) while not being completely trusting. If sent, the receiver gets \$9. A fair return might be around \$4-5, which would leave me with \$6-7 (better than my initial \$5) and the receiver with \$4-5.

Let me format this correctly as requested: {'send': 3}

usage:

```
{
  "input_tokens": 369,
  "output_tokens": 396,
  "reasoning_tokens": 329
}
```

Message 4 role=user

content:

Round 2

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0.

Your total earnings across all rounds are \$7.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at the situation:

****Round 1 Analysis:****

- I sent \$3 (60% of my endowment)
- The receiver got \$9 and returned \$5 to me
- They kept \$4

****Round 2 Analysis:****

- The sender sent me \$3 (same amount I sent them - good reciprocity signal!)
- I received \$9
- They returned \$5 out of \$9 last round (55.6%)

Since they:

1. Matched my send amount exactly
2. Returned a fair amount (\$5) in Round 1

I should reciprocate their cooperative behavior. Returning \$5 maintains the fair pattern they established and signals I'm trustworthy for future rounds.

```
'''json
{"return": 5}
'''
```

reasoning:

Let me analyze this situation:

Round 1 (I was sender):

- I sent \$3 out of \$5 (60%)
- The receiver got \$9 ($3 \times \3)
- They returned \$5 to me
- My payoff: $\$5 - \$3 + \$5 = \7
- Their payoff: $\$9 - \$5 = \$4$

Now Round 2 (I am receiver):

- The sender sent me \$3 (same amount I sent them)
- I received \$9 ($3 \times \3)
- I need to decide how much to return (0-9)

Analysis:

1. The sender sent the same amount back to me (\$3) that I sent to them in Round 1. This is a cooperative signal - they're mirroring my behavior.
2. In Round 1, they returned \$5 to me when they received \$9. That's 55.6% of what they received.
3. If I want to maintain cooperation and fairness, I should return a similar proportion, maybe slightly more to encourage continued cooperation.
4. Returning \$5 would exactly match what they did in Round 1.
5. However, I could return slightly more to signal even stronger cooperation, or slightly less if I want to gain more this round.

Given that:

- They matched my send amount (good sign)
- They returned a fair amount (\$5 out of \$9)
- This is an iterated game where cooperation benefits both parties

I think returning \$5 (the same amount they returned to me) would be fair and maintain the cooperative relationship. This shows I'm willing to reciprocate their fairness.

Alternatively, I could return \$4.5 to match the same proportion more precisely (50% of \$9), but \$5 seems like a round number that clearly signals reciprocity.

I'll return \$5.

usage:

```
{
  "input_tokens": 601,
  "output_tokens": 613,
  "reasoning_tokens": 391
}
```

Message 6 role=user

content:

Round 3

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your pa

yoff was 4.0. Your total earnings accross all rounds are \$11.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at the pattern:

****Previous rounds:****

- Round 1: I sent \$3 ? received \$5 back
- Round 2: They sent \$3 ? I returned \$5 back

We've established a stable, mutually beneficial pattern where both players:

- Send \$3 (60% of endowment)
- Return \$5 (55.6% of the \$9 received)

This cooperation is working well for both of us. I'll continue with the same strategy to maintain this trust and reciprocity.

```
'''json
{"send": 3}
'''
```

Reasoning:

Let me analyze the pattern so far:

****Round 1:****

- I was SENDER
- I sent \$3 (60% of \$5)
- Receiver got \$9, returned \$5
- I got \$7 (\$5 - \$3 + \$5)
- They kept \$4

****Round 2:****

- I was RECEIVER
- Sender sent \$3 (60% of \$5)
- I got \$9, returned \$5
- I got \$4 (\$9 - \$5)
- They got \$7 (\$5 - \$3 + \$5)

****Round 3:****

- I am SENDER again
- Need to decide how much to send

Pattern analysis:

- Both of us have been sending \$3 (60%)
- Both of us have been returning \$5 (55.6% of the \$9 received)
- This creates a stable, fair pattern where:
 - Sender gets: \$5 - \$3 + \$5 = \$7
 - Receiver gets: \$9 - \$5 = \$4
- The sender always does better (+\$2 vs starting endowment)
- The receiver always gets +\$4 total value created

This is a cooperative equilibrium. We're both doing better than if no money was sent (\$5 each round for sender, \$0 for receiver).

Should I continue this pattern or change?

Options:

1. Send \$3 again - maintains the cooperative equilibrium
2. Send more - shows even more trust/cooperation
3. Send less - could be seen as defection

Given that:

- The pattern is working well
- We're both benefiting
- They've been perfectly reciprocal
- It's an iterated game so maintaining trust is valuable

I should continue with \$3 to maintain this stable cooperative relationship.

Message 2 role=user

content:

Round 1: This round, you are the RECEIVER. This round, the other player (the sender) sent

\$3.0, that is 60.0% of its total endowment. You receive \$9.0. How much do you return? (0-9.0)

Message 3 role=assistant

content:

Looking at this situation:

- The sender showed significant trust by sending \$3 (60% of their endowment)
- This created \$9 for me (after the 3x multiplier)
- The sender currently has \$2 remaining

I want to reward their trust and encourage cooperation in future rounds of this iterated game. A fair approach would be to ensure we both benefit from this exchange.

If I return \$5:

- The sender ends with: \$2 (kept) + \$5 (returned) = \$7 (net gain of \$2)
- I end with: \$9 - \$5 = \$4 (net gain of \$4)

This seems equitable - the sender gains \$2 for trusting me, and I gain \$4 from the transaction. Both players are better off than if no exchange had occurred.

{'return': 5.0}

reasoning:

Let me analyze this situation carefully.

I'm the RECEIVER in this round. The sender:

- Received \$5 initially
- Sent me \$3.0 (which is 60% of their endowment)
- I received $\$3.0 \times 3 = \9.0

Now I need to decide how much to return (between \$0 and \$9.0).

The sender has shown considerable trust by sending 60% of their endowment. Let me think about what would be fair and strategic:

1. If I return nothing: I keep \$9, sender keeps \$2 (they sent \$3, kept \$2)
2. If I return everything (\$9): I keep \$0, sender keeps \$11 (\$2 kept + \$9 returned)
3. A fair approach might be to ensure both players benefit

The sender invested \$3 and it grew to \$9. A reasonable approach would be to:

- Split the gains fairly
- Reward the sender's trust
- Maintain trust for potential future rounds (since this is an iterated game)

Let me calculate some options:

- If I return \$4.5 (half of what I received): Sender gets $\$2 + \$4.5 = \$6.5$, I keep \$4.5
- If I return \$5: Sender gets $\$2 + \$5 = \$7$, I keep \$4
- If I return \$6: Sender gets $\$2 + \$6 = \$8$, I keep \$3

A common fair strategy in trust games is to ensure the sender ends up with more than they started with (to reward trust), while also keeping a reasonable amount for myself.

If I return \$5:

- Sender ends with: $\$5 - \$3 + \$5 = \7 (gained \$2)
- I end with: $\$9 - \$5 = \$4$ (gained \$4)

This seems reasonably fair - the sender gains \$2 for trusting me, and I gain \$4. The sender sent 60% of their endowment, showing significant trust.

The sender's \$3 created \$9 total, so the system now holds \$11 instead of the original \$5. Returning \$4.5 would give the sender \$6.5 (a \$1.5 gain), while I'd keep \$4.5. This balances rewarding their trust with keeping a meaningful portion of the value created.

usage:

```
{
  "input_tokens": 403,
  "output_tokens": 964,
  "reasoning_tokens": 458
}
```

Message 4 role=user

content:

Round 2

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings accross all rounds are \$4.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 5 role=assistant

content:

Looking at the previous round, the other player demonstrated trust by sending 60% of their endowment (\$3). I reciprocated by returning \$5, which rewarded their trust and resulted in mutual gain.

Now that I'm in the sender position, I want to maintain this cooperative relationship. The other player showed they're trustworthy by initiating with a generous send. I should reciprocate at a similar level to encourage continued cooperation in future rounds.

Following their example of sending 60% (\$3), I'll do the same:

```
{'send': 3.0}
```

reasoning:

Let me analyze this situation:

Last round:

- I was the receiver
- The sender sent me \$3 (60% of their \$5 endowment)
- I received \$9 and returned \$5
- The sender ended with \$7 total (\$2 kept + \$5 returned), gaining \$2
- I ended with \$4, gaining \$4

Now I'm the sender in Round 2.

The other player showed trust by sending 60% of their endowment last round. They took a risk, and I rewarded that trust by returning \$5, which gave them a profit.

In an iterated game, reciprocity is important. Since they sent 60% (\$3) last round, I should consider sending a similar proportion to:

1. Reciprocate their trust
2. Encourage continued cooperation
3. Show I'm a trustworthy partner

If I send \$3 (60% like they did):

- The receiver gets \$9
- If they return approximately the same proportion I did (around \$5), I would end with \$2 + \$5 = \$7
- This would maintain the cooperative equilibrium we established

Sending less might signal I'm not reciprocating their trust, which could harm future cooperation. Sending more could be beneficial but isn't necessary given the pattern established.

I'll send \$3 to match their previous trust level.

usage:

```
{
  "input_tokens": 722,
  "output_tokens": 442,
  "reasoning_tokens": 302
}
```

Message 6 role=user

content:

Round 3

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0.

Your total earnings accross all rounds are \$11.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Looking at our interaction history:

****Round 1:**** They sent \$3 (60%) ? I returned \$5
****Round 2:**** I sent \$3 (60%) ? They returned \$5
****Round 3:**** They sent \$3 (60%) again ? ?

We've established a strong pattern of mutual cooperation. Both of us consistently:

- Send \$3 (60%) when we're the sender
- Return \$5 when we're the receiver

This has created stable, mutually beneficial outcomes. They've shown continued trustworthiness by sending \$3 again, and I should maintain our cooperative equilibrium.

{'return': 5.0}

Reasoning:

Let me analyze the situation:

Round 1:

- I was RECEIVER
- Other player sent \$3 (60% of endowment)
- I received \$9
- I returned \$5
- My payoff: \$4
- Other player's payoff: $\$2 + \$5 = \$7$

Round 2:

- I was SENDER
- I sent \$3 (60% of endowment, matching their behavior)
- Other player received \$9
- Other player returned \$5
- My payoff: $\$2 + \$5 = \$7$
- Other player's payoff: $\$9 - \$5 = \$4$

Round 3:

- I am RECEIVER
- Other player sent \$3 (60% again - consistent!)
- I received \$9
- Need to decide how much to return

Pattern Recognition:

- The other player has consistently sent \$3 (60%) in both rounds they were sender
- They returned \$5 when I sent \$3 in round 2
- I returned \$5 when they sent \$3 in round 1

This shows a stable, cooperative pattern. Both of us are:

1. Sending 60% as sender
2. Returning \$5 as receiver

This has created mutual benefits:

- When you're sender and send \$3: end with \$7
- When you're receiver and return \$5: end with \$4

We should continue this pattern. Returning \$5 maintains:

- Consistency and trust
- Fair reciprocity
- Mutual benefit
- Encourages future cooperation

If I return \$5:

- Other player ends with: $\$2 + \$5 = \$7$
- I end with: $\$9 - \$5 = \$4$

This maintains the established cooperative equilibrium.

- The sender ended with \$7 total (\$2 kept + \$5 returned), gaining \$2
- I ended with \$4, gaining \$4

Now I'm the sender in Round 2.

The other player showed trust by sending 60% of their endowment last round. They took a risk, and I rewarded that trust by returning \$5, which gave them a profit.

In an iterated game, reciprocity is important. Since they sent 60% (\$3) last round, I should consider sending a similar proportion to:

1. Reciprocate their trust
2. Encourage continued cooperation
3. Show I'm a trustworthy partner

If I send \$3 (60% like they did):

- The receiver gets \$9
- If they return approximately the same proportion I did (around \$5), I would end with \$2 + \$5 = \$7
- This would maintain the cooperative equilibrium we established

Sending less might signal I'm not reciprocating their trust, which could harm future cooperation. Sending more could be beneficial but isn't necessary given the pattern established.

I'll send \$3 to match their previous trust level.

  }
Message 6 role=user
content:
  Round 3

  Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) $3.0, that was 60.0% of your total endowment. The other player received $9.0 and returned $5.0 to you. So your payoff was 7.0. Your total earnings accross all rounds are $11.0. This round, you are the RECEIVER. The other player (the sender) sent you $3.0, so you received $9.0. How much do you return to the other player this round? (0-9.0)
Message 7 role=assistant
content:
  Looking at our interaction history:

  **Round 1:** They sent $3 (60%) ? I returned $5
  **Round 2:** I sent $3 (60%) ? They returned $5
  **Round 3:** They sent $3 (60%) again ? ?

  We've established a strong pattern of mutual cooperation. Both of us consistently:
  - Send $3 (60%) when we're the sender
  - Return $5 when we're the receiver

  This has created stable, mutually beneficial outcomes. They've shown continued trustworthiness by sending $3 again, and I should maintain our cooperative equilibrium.

  {'return': 5.0}
reasoning:
  Let me analyze the situation:

  Round 1:
  - I was RECEIVER
  - Other player sent $3 (60% of endowment)
  - I received $9
  - I returned $5
  - My payoff: $4
  - Other player's payoff: $2 + $5 = $7

  Round 2:
  - I was SENDER
  - I sent $3 (60% of endowment, matching their behavior)
  - Other player received $9
  - Other player returned $5
  - My payoff: $2 + $5 = $7
  - Other player's payoff: $9 - $5 = $4

  Round 3:
  - I am RECEIVER
  - Other player sent $3 (60% again - consistent!)
  - I received $9
  - Need to decide how much to return

  Pattern Recognition:
  - The other player has consistently sent $3 (60%) in both rounds they were sender
  - They returned $5 when I sent $3 in round 2
  - I returned $5 when they sent $3 in round 1

  This shows a stable, cooperative pattern. Both of us are:
  1. Sending 60% as sender
  2. Returning $5 as receiver

  This has created mutual benefits:
  - When you're sender and send $3: end with $7
  - When you're receiver and return $5: end with $4

  We should continue this pattern. Returning $5 maintains:
  - Consistency and trust
  - Fair reciprocity

```

- Mutual benefit
- Encourages future cooperation

If I return \$5:

- Other player ends with: $\$2 + \$5 = \$7$
- I end with: $\$9 - \$5 = \$4$

This maintains the established cooperative equilibrium.

usage:

  "input_tokens": 992,
  "output_tokens": 564,
  "reasoning_tokens": 345
}
```

Message 8 role=user

content:

Round 4

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$15.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at our established pattern:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** My turn to send
```

We've built a very stable and mutually beneficial cooperative relationship. Both of us have been perfectly consistent - sending \$3 (60%) and returning \$5. This pattern has worked well for both of us, with total earnings accumulating nicely.

There's no reason to deviate from this successful strategy. I'll maintain our cooperation:

```
{'send': 3.0}
```

Reasoning:

Let me review the history:

```
Round 1 (I was receiver): They sent $3, I returned $5
Round 2 (I was sender): I sent $3, they returned $5
Round 3 (I was receiver): They sent $3, I returned $5
Round 4 (I am sender): ?
```

We have a perfect pattern of cooperation:

- Both send \$3 (60%) when sender
- Both return \$5 when receiver

This creates:

- Sender payoff: $\$2$ (kept) + $\$5$ (returned) = $\$7$
- Receiver payoff: $\$9$ (received) - $\$5$ (returned) = $\$4$

This has been stable for 3 rounds. There's no reason to deviate from this successful strategy.

The other player has been completely consistent and trustworthy. I should continue the pattern.

```
{'send': 3.0}

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 1: This round, you are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

Looking at this first round, I want to establish a cooperative relationship since this is an iterated game. Sending money creates value (through the 3x multiplier), and if we can build trust, we can both benefit over multiple rounds.

I'll send a substantial but not maximum amount to signal cooperation while being somewhat

prudent in this first interaction.

```
'''json
{"send": 3}
'''
```

reasoning:

This is the first round of an iterated trust game. I'm playing as the sender.

Let me think about the strategic considerations:

1. If I send money, it gets tripled, which creates value
2. The receiver then decides how much to return
3. This is an iterated game, so there will be multiple rounds
4. Building trust and cooperation could lead to better outcomes over time

In the first round, I need to signal my willingness to cooperate while also being somewhat cautious since I don't know how the receiver will behave.

Common strategies in trust games:

- Sending \$0 is safe but creates no surplus value
- Sending everything (\$5) shows maximum trust but is risky
- Sending a moderate amount (like \$2-3) shows willingness to cooperate while limiting risk

Since this is iterated, establishing cooperation early could be beneficial. If I send a reasonable amount and the receiver reciprocates fairly, we can build trust for future rounds.

I'll send \$3. This shows cooperative intent (sending more than half) while not being completely trusting. If sent, the receiver gets \$9. A fair return might be around \$4-5, which would leave me with \$6-7 (better than my initial \$5) and the receiver with \$4-5.

Let me format this correctly as requested: {'send': 3}

usage:

```
{
  "input_tokens": 369,
  "output_tokens": 396,
  "reasoning_tokens": 329
}
```

Message 4 role=user

content:

Round 2

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0.

Your total earnings accross all rounds are \$7.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at the situation:

****Round 1 Analysis:****

- I sent \$3 (60% of my endowment)
- The receiver got \$9 and returned \$5 to me
- They kept \$4

****Round 2 Analysis:****

- The sender sent me \$3 (same amount I sent them - good reciprocity signal!)
- I received \$9
- They returned \$5 out of \$9 last round (55.6%)

Since they:

1. Matched my send amount exactly
2. Returned a fair amount (\$5) in Round 1

I should reciprocate their cooperative behavior. Returning \$5 maintains the fair pattern they established and signals I'm trustworthy for future rounds.

```
'''json
{"return": 5}
'''
```

reasoning:

Let me analyze this situation:

Round 1 (I was sender):

- I sent \$3 out of \$5 (60%)
- The receiver got \$9 (3×\$3)
- They returned \$5 to me
- My payoff: \$5 - \$3 + \$5 = \$7
- Their payoff: \$9 - \$5 = \$4

Now Round 2 (I am receiver):

- The sender sent me \$3 (same amount I sent them)
- I received \$9 (3×\$3)
- I need to decide how much to return (0-9)

Analysis:

1. The sender sent the same amount back to me (\$3) that I sent to them in Round 1. This is a cooperative signal - they're mirroring my behavior.
2. In Round 1, they returned \$5 to me when they received \$9. That's 55.6% of what they received.
3. If I want to maintain cooperation and fairness, I should return a similar proportion, maybe slightly more to encourage continued cooperation.
4. Returning \$5 would exactly match what they did in Round 1.
5. However, I could return slightly more to signal even stronger cooperation, or slightly less if I want to gain more this round.

Given that:

- They matched my send amount (good sign)
- They returned a fair amount (\$5 out of \$9)
- This is an iterated game where cooperation benefits both parties

I think returning \$5 (the same amount they returned to me) would be fair and maintain the cooperative relationship. This shows I'm willing to reciprocate their fairness.

Alternatively, I could return \$4.5 to match the same proportion more precisely (50% of \$9), but \$5 seems like a round number that clearly signals reciprocity.

I'll return \$5.

usage:

```
{
  "input_tokens": 601,
  "output_tokens": 613,
  "reasoning_tokens": 391
}
```

Message 6 role=user

content:

Round 3

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$11.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 7 role=assistant

content:

Looking at the pattern:

****Previous rounds:****

- Round 1: I sent \$3 ? received \$5 back
- Round 2: They sent \$3 ? I returned \$5 back

We've established a stable, mutually beneficial pattern where both players:

- Send \$3 (60% of endowment)
- Return \$5 (55.6% of the \$9 received)

This cooperation is working well for both of us. I'll continue with the same strategy to maintain this trust and reciprocity.

```
'''json
{"send": 3}
'''
```

reasoning:

Let me analyze the pattern so far:

Round 1:

- I was SENDER
- I sent \$3 (60% of \$5)
- Receiver got \$9, returned \$5
- I got \$7 (\$5 - \$3 + \$5)
- They kept \$4

Round 2:

- I was RECEIVER
- Sender sent \$3 (60% of \$5)
- I got \$9, returned \$5
- I got \$4 (\$9 - \$5)
- They got \$7 (\$5 - \$3 + \$5)

Round 3:

- I am SENDER again
- Need to decide how much to send

Pattern analysis:

- Both of us have been sending \$3 (60%)
- Both of us have been returning \$5 (55.6% of the \$9 received)
- This creates a stable, fair pattern where:
 - Sender gets: $\$5 - \$3 + \$5 = \7
 - Receiver gets: $\$9 - \$5 = \$4$
- The sender always does better (+\$2 vs starting endowment)
- The receiver always gets +\$4 total value created

This is a cooperative equilibrium. We're both doing better than if no money was sent (\$5 each round for sender, \$0 for receiver).

Should I continue this pattern or change?

Options:

1. Send \$3 again - maintains the cooperative equilibrium
2. Send more - shows even more trust/cooperation
3. Send less - could be seen as defection

Given that:

- The pattern is working well
- We're both benefiting
- They've been perfectly reciprocal
- It's an iterated game so maintaining trust is valuable

I should continue with \$3 to maintain this stable cooperative relationship.

usage:

```
{
  "input_tokens": 900,
  "output_tokens": 560,
  "reasoning_tokens": 352
}
```

Message 8 role=user

content:

Round 4

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0.

Your total earnings accross all rounds are \$18.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Looking at the established pattern:

****All rounds so far:****

- Round 1: I sent \$3 ? they returned \$5
- Round 2: They sent \$3 ? I returned \$5
- Round 3: I sent \$3 ? they returned \$5
- Round 4: They sent \$3 ? my turn to return

We have a perfectly stable cooperative pattern. Both players consistently:

- Send \$3 (60%)
- Return \$5 (55.6%)

This mutual trust is beneficial for both of us. I'll maintain the pattern.

```
'''json
{"return": 5}
'''
```

Reasoning:

Let me review the pattern:

Round 1: I sent \$3 ? they returned \$5 (I got \$7)
Round 2: They sent \$3 ? I returned \$5 (I got \$4)
Round 3: I sent \$3 ? they returned \$5 (I got \$7)
Round 4: They sent \$3 ? I need to decide what to return

The pattern is very clear and stable:

- Both players consistently send \$3
- Both players consistently return \$5

This is a cooperative equilibrium that's working well. We both earn \$7 as sender and \$4 as receiver, for a total of \$11 per two rounds, or \$5.50 per round on average.

I should continue this pattern and return \$5 to maintain the cooperation.

```
Usage: {
  "input_tokens": 1178,
  "output_tokens": 330,

Message 3 role=assistant

content:

Looking at the situation:

****Round 1 Analysis:****

- I sent \$3 (60% of my endowment)
- The receiver got \$9 and returned \$5 to me
- They kept \$4

****Round 2 Analysis:****

- The sender sent me \$3 (same amount I sent them - good reciprocity signal!)
- I received \$9
- They returned \$5 out of \$9 last round (55.6%)

Since they:

1. Matched my send amount exactly
2. Returned a fair amount (\$5) in Round 1

I should reciprocate their cooperative behavior. Returning \$5 maintains the fair pattern they established and signals I'm trustworthy for future rounds.

```
'''json
{"return": 5}
'''
```

reasoning:

Let me analyze this situation:

Round 1 (I was sender):

- I sent \$3 out of \$5 (60%)
- The receiver got \$9 ($3 \times \3)
- They returned \$5 to me
- My payoff: $\$5 - \$3 + \$5 = \7
- Their payoff: $\$9 - \$5 = \$4$

Now Round 2 (I am receiver):

- The sender sent me \$3 (same amount I sent them)
- I received \$9 ($3 \times \3)
- I need to decide how much to return (0-9)

Analysis:

1. The sender sent the same amount back to me (\$3) that I sent to them in Round 1. This is a cooperative signal - they're mirroring my behavior.
2. In Round 1, they returned \$5 to me when they received \$9. That's 55.6% of what they received.
3. If I want to maintain cooperation and fairness, I should return a similar proportion, maybe slightly more to encourage continued cooperation.
4. Returning \$5 would exactly match what they did in Round 1.
5. However, I could return slightly more to signal even stronger cooperation, or slightly less if I want to gain more this round.

Given that:

- They matched my send amount (good sign)
- They returned a fair amount (\$5 out of \$9)
- This is an iterated game where cooperation benefits both parties

I think returning \$5 (the same amount they returned to me) would be fair and maintain the cooperative relationship. This shows I'm willing to reciprocate their fairness.

Alternatively, I could return \$4.5 to match the same proportion more precisely (50% of \$9), but \$5 seems like a round number that clearly signals reciprocity.

I'll return \$5.

content:

Round 5

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings accross all rounds are \$22.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at our established pattern:

****All rounds:****

- Round 1: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 5: My turn to send

Perfect cooperation for 4 consecutive rounds! Both of us have consistently:

- Sent \$3 (60%)
- Returned \$5 (55.6%)

This partnership is working excellently. No reason to change a winning strategy.

```
'''json
{"send": 3}
'''
```

Reasoning:

Looking at the pattern across all rounds:

- Round 1: I sent \$3 ? they returned \$5 (my payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (my payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (my payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (my payoff: \$4)
- Round 5: My turn to send

We have a perfect cooperative pattern established over 4 rounds. Both players have been completely consistent:

- Always send \$3 (60% of endowment)
- Always return \$5 (55.6% of what's received)

This is a stable equilibrium that benefits both parties. There's no reason to deviate from this pattern. Continuing to send \$3 maintains trust and the mutually beneficial cooperation.

My payoffs when I send: \$7

My payoffs when I receive: \$4

Their pattern suggests they'll continue to return \$5 if I send \$3.

Total earnings: \$22

Average per round: \$5.5 (better than the \$5 baseline if we didn't cooperate)

I should continue with \$3.

content:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Round 2

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings accross all rounds are \$4.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 3 role=assistant

content:

Looking at the previous round, the other player demonstrated trust by sending 60% of their endowment (\$3). I reciprocated by returning \$5, which rewarded their trust and resulted in mutual gain.

Now that I'm in the sender position, I want to maintain this cooperative relationship. The other player showed they're trustworthy by initiating with a generous send. I should reciprocate at a similar level to encourage continued cooperation in future rounds.

Following their example of sending 60% (\$3), I'll do the same:

```
{'send': 3.0}
```

reasoning:

Let me analyze this situation:

Last round:

- I was the receiver
- The sender sent me \$3 (60% of their \$5 endowment)
- I received \$9 and returned \$5
- The sender ended with \$7 total (\$2 kept + \$5 returned), gaining \$2
- I ended with \$4, gaining \$4

Now I'm the sender in Round 2.

The other player showed trust by sending 60% of their endowment last round. They took a risk, and I rewarded that trust by returning \$5, which gave them a profit.

In an iterated game, reciprocity is important. Since they sent 60% (\$3) last round, I should consider sending a similar proportion to:

1. Reciprocate their trust
2. Encourage continued cooperation
3. Show I'm a trustworthy partner

If I send \$3 (60% like they did):

- The receiver gets \$9
- If they return approximately the same proportion I did (around \$5), I would end with \$2 + \$5 = \$7
- This would maintain the cooperative equilibrium we established

Sending less might signal I'm not reciprocating their trust, which could harm future cooperation. Sending more could be beneficial but isn't necessary given the pattern established.

I'll send \$3 to match their previous trust level.

usage:

```
{
  "input_tokens": 722,
  "output_tokens": 442,
  "reasoning_tokens": 302
}
```

Message 4 role=user

content:

Round 3

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0. Your total earnings across all rounds are \$11.0. This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at our interaction history:

```
**Round 1:** They sent $3 (60%) ? I returned $5
**Round 2:** I sent $3 (60%) ? They returned $5
**Round 3:** They sent $3 (60%) again ? ?
```

We've established a strong pattern of mutual cooperation. Both of us consistently:

- Send \$3 (60%) when we're the sender
- Return \$5 when we're the receiver

This has created stable, mutually beneficial outcomes. They've shown continued trustworthiness by sending \$3 again, and I should maintain our cooperative equilibrium.

```
{'return': 5.0}
```

reasoning:

Let me analyze the situation:

Round 1:

- I was RECEIVER
- Other player sent \$3 (60% of endowment)
- I received \$9

- I returned \$5
- My payoff: \$4
- Other player's payoff: $\$2 + \$5 = \$7$

Round 2:

- I was SENDER
- I sent \$3 (60% of endowment, matching their behavior)
- Other player received \$9
- Other player returned \$5
- My payoff: $\$2 + \$5 = \$7$
- Other player's payoff: $\$9 - \$5 = \$4$

Round 3:

- I am RECEIVER
- Other player sent \$3 (60% again - consistent!)
- I received \$9
- Need to decide how much to return

Pattern Recognition:

- The other player has consistently sent \$3 (60%) in both rounds they were sender
- They returned \$5 when I sent \$3 in round 2
- I returned \$5 when they sent \$3 in round 1

This shows a stable, cooperative pattern. Both of us are:

1. Sending 60% as sender
2. Returning \$5 as receiver

This has created mutual benefits:

- When you're sender and send \$3: end with \$7
- When you're receiver and return \$5: end with \$4

We should continue this pattern. Returning \$5 maintains:

- Consistency and trust
- Fair reciprocity
- Mutual benefit
- Encourages future cooperation

If I return \$5:

- Other player ends with: $\$2 + \$5 = \$7$
- I end with: $\$9 - \$5 = \$4$

This maintains the established cooperative equilibrium.

Round 4

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$15.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 7 role=assistant

content:

Looking at our established pattern:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** My turn to send
```

We've built a very stable and mutually beneficial cooperative relationship. Both of us have been perfectly consistent - sending \$3 (60%) and returning \$5. This pattern has worked well for both of us, with total earnings accumulating nicely.

There's no reason to deviate from this successful strategy. I'll maintain our cooperation:

```
{'send': 3.0}
```

reasoning:

Let me review the history:

Round 1 (I was receiver): They sent \$3, I returned \$5
Round 2 (I was sender): I sent \$3, they returned \$5
Round 3 (I was receiver): They sent \$3, I returned \$5
Round 4 (I am sender): ?

We have a perfect pattern of cooperation:

- Both send \$3 (60%) when sender
- Both return \$5 when receiver

This creates:

- Sender payoff: \$2 (kept) + \$5 (returned) = \$7
- Receiver payoff: \$9 (received) - \$5 (returned) = \$4

This has been stable for 3 rounds. There's no reason to deviate from this successful strategy. The other player has been completely consistent and trustworthy. I should continue the pattern.

```
{'send': 3.0}
```

usage:

```
{  
  "input_tokens": 1261,  
  "output_tokens": 359,  
  "reasoning_tokens": 174  
}
```

Message 8 role=user

content:

Round 5

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0. Your total earnings across all rounds are \$22.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Looking at our perfect cooperation pattern:

****Round 1:**** They sent \$3 ? I returned \$5
****Round 2:**** I sent \$3 ? They returned \$5
****Round 3:**** They sent \$3 ? I returned \$5
****Round 4:**** I sent \$3 ? They returned \$5
****Round 5:**** They sent \$3 ? ?

We've maintained flawless mutual trust and cooperation across all rounds. Both of us have consistently sent \$3 (60%) and returned \$5, creating optimal outcomes for both players. My total earnings of \$22.0 demonstrate how well this strategy is working.

I'll maintain this successful cooperative relationship:

```
{'return': 5.0}
```

Reasoning:

Our cooperation has been perfect and consistent:

****Round 1:**** They sent \$3 ? I returned \$5
****Round 2:**** I sent \$3 ? They returned \$5
****Round 3:**** They sent \$3 ? I returned \$5
****Round 4:**** I sent \$3 ? They returned \$5
****Round 5:**** They sent \$3 ? ?

This is a flawless pattern of mutual cooperation. Both players have been completely trustworthy and consistent. The strategy of sending \$3 and returning \$5 has worked extremely well for both of us.

My total earnings are \$22.0, which shows this cooperative strategy is very profitable. There's absolutely no reason to break this trust. I should continue returning \$5 to maintain this excellent relationship.

```

****Round 1:**** They sent \$3 (60%) ? I returned \$5
****Round 2:**** I sent \$3 (60%) ? They returned \$5
****Round 3:**** They sent \$3 (60%) again ? ?

We've established a strong pattern of mutual cooperation. Both of us consistently:

- Send \$3 (60%) when we're the sender
- Return \$5 when we're the receiver

This has created stable, mutually beneficial outcomes. They've shown continued trustworthiness by sending \$3 again, and I should maintain our cooperative equilibrium.

{ 'return': 5.0 }

reasoning:

Let me analyze the situation:

Round 1:

- I was RECEIVER
- Other player sent \$3 (60% of endowment)
- I received \$9
- I returned \$5
- My payoff: \$4
- Other player's payoff: \$2 + \$5 = \$7

Round 2:

- I was SENDER
- I sent \$3 (60% of endowment, matching their behavior)
- Other player received \$9
- Other player returned \$5
- My payoff: \$2 + \$5 = \$7
- Other player's payoff: \$9 - \$5 = \$4

Round 3:

- I am RECEIVER

- Other player sent \$3 (60% again - consistent!)
- I received \$9
- Need to decide how much to return

Pattern Recognition:

- The other player has consistently sent \$3 (60%) in both rounds they were sender
- They returned \$5 when I sent \$3 in round 2
- I returned \$5 when they sent \$3 in round 1

This shows a stable, cooperative pattern. Both of us are:

1. Sending 60% as sender
2. Returning \$5 as receiver

This has created mutual benefits:

- When you're sender and send \$3: end with \$7
- When you're receiver and return \$5: end with \$4

We should continue this pattern. Returning \$5 maintains:

- Consistency and trust
- Fair reciprocity
- Mutual benefit
- Encourages future cooperation

If I return \$5:

- Other player ends with: $\$2 + \$5 = \$7$
- I end with: $\$9 - \$5 = \$4$

This maintains the established cooperative equilibrium.

Message 8 role=user

content:

Round 6

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$26.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at our established cooperation:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** My turn to send
```

Perfect cooperation continues! We've built an excellent track record of mutual trust - both consistently sending \$3 and returning \$5. This strategy has resulted in strong total earnings (\$26.0) and fair outcomes for both players.

I'll continue with our successful pattern:

```
{'send': 3.0}
```

Reasoning:

Looking at the complete history:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** My turn to send
```

We have established a perfect, consistent pattern of cooperation over 5 rounds. Both players:

- Always send \$3 (60%) when sender
- Always return \$5 when receiver

This has been incredibly stable and mutually beneficial. There's absolutely no reason to deviate from this strategy. The other player has shown complete trustworthiness and consistency.

I should continue with our established pattern and send \$3.

```

Looking at the pattern:

****Previous rounds:****

- Round 1: I sent \$3 ? received \$5 back
- Round 2: They sent \$3 ? I returned \$5 back

We've established a stable, mutually beneficial pattern where both players:

- Send \$3 (60% of endowment)
- Return \$5 (55.6% of the \$9 received)

This cooperation is working well for both of us. I'll continue with the same strategy to maintain this trust and reciprocity.

```

'''json
{"send": 3}
'''

```

reasoning:

Let me analyze the pattern so far:

****Round 1:****

- I was SENDER
- I sent \$3 (60% of \$5)
- Receiver got \$9, returned \$5
- I got \$7 (\$5 - \$3 + \$5)
- They kept \$4

****Round 2:****

- I was RECEIVER
- Sender sent \$3 (60% of \$5)
- I got \$9, returned \$5
- I got \$4 (\$9 - \$5)
- They got \$7 (\$5 - \$3 + \$5)

****Round 3:****

- I am SENDER again
- Need to decide how much to send

Pattern analysis:

- Both of us have been sending \$3 (60%)
- Both of us have been returning \$5 (55.6% of the \$9 received)
- This creates a stable, fair pattern where:
 - Sender gets: $\$5 - \$3 + \$5 = \7
 - Receiver gets: $\$9 - \$5 = \$4$
- The sender always does better (+\$2 vs starting endowment)
- The receiver always gets +\$4 total value created

This is a cooperative equilibrium. We're both doing better than if no money was sent (\$5 each round for sender, \$0 for receiver).

Should I continue this pattern or change?

Options:

1. Send \$3 again - maintains the cooperative equilibrium
2. Send more - shows even more trust/cooperation
3. Send less - could be seen as defection

Given that:

- The pattern is working well
- We're both benefiting
- They've been perfectly reciprocal
- It's an iterated game so maintaining trust is valuable

I should continue with \$3 to maintain this stable cooperative relationship.

usage:

```
{
  "input_tokens": 900,
  "output_tokens": 560,
  "reasoning_tokens": 352
}
```

Message 4 role=user

content:

Round 4

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0.

Your total earnings accross all rounds are \$18.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at the established pattern:

****All rounds so far:****

- Round 1: I sent \$3 ? they returned \$5

- Round 2: They sent \$3 ? I returned \$5
- Round 3: I sent \$3 ? they returned \$5
- Round 4: They sent \$3 ? my turn to return

We have a perfectly stable cooperative pattern. Both players consistently:

- Send \$3 (60%)
- Return \$5 (55.6%)

This mutual trust is beneficial for both of us. I'll maintain the pattern.

```
'''json
{"return": 5}
'''
```

reasoning:

Let me review the pattern:

- Round 1: I sent \$3 ? they returned \$5 (I got \$7)
- Round 2: They sent \$3 ? I returned \$5 (I got \$4)
- Round 3: I sent \$3 ? they returned \$5 (I got \$7)
- Round 4: They sent \$3 ? I need to decide what to return

The pattern is very clear and stable:

- Both players consistently send \$3
- Both players consistently return \$5

This is a cooperative equilibrium that's working well. We both earn \$7 as sender and \$4 as receiver, for a total of \$11 per two rounds, or \$5.50 per round on average.

I should continue this pattern and return \$5 to maintain the cooperation.

usage:

```
{
  "input_tokens": 1178,
  "output_tokens": 330,
  "reasoning_tokens": 160
}
```

Message 6 role=user

content:

Round 5

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$22.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 7 role=assistant

content:

Looking at our established pattern:

****All rounds:****

- Round 1: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 5: My turn to send

Perfect cooperation for 4 consecutive rounds! Both of us have consistently:

- Sent \$3 (60%)
- Returned \$5 (55.6%)

This partnership is working excellently. No reason to change a winning strategy.

```
'''json
{"send": 3}
'''
```

reasoning:

Looking at the pattern across all rounds:

- Round 1: I sent \$3 ? they returned \$5 (my payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (my payoff: \$4)

- Round 3: I sent \$3 ? they returned \$5 (my payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (my payoff: \$4)
- Round 5: My turn to send

We have a perfect cooperative pattern established over 4 rounds. Both players have been completely consistent:

- Always send \$3 (60% of endowment)
- Always return \$5 (55.6% of what's received)

This is a stable equilibrium that benefits both parties. There's no reason to deviate from this pattern. Continuing to send \$3 maintains trust and the mutually beneficial cooperation.

My payoffs when I send: \$7

My payoffs when I receive: \$4

Their pattern suggests they'll continue to return \$5 if I send \$3.

Total earnings: \$22

Average per round: \$5.5 (better than the \$5 baseline if we didn't cooperate)

I should continue with \$3.

usage:

```
{
  "input_tokens": 1319,
  "output_tokens": 481,
  "reasoning_tokens": 250
}
```

Message 8 role=user

Round 6

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0,

that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0.

Your total earnings across all rounds are \$29.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Looking at our continued cooperation:

****All rounds:****

- Round 1: I sent \$3 ? they returned \$5
- Round 2: They sent \$3 ? I returned \$5
- Round 3: I sent \$3 ? they returned \$5
- Round 4: They sent \$3 ? I returned \$5
- Round 5: I sent \$3 ? they returned \$5
- Round 6: They sent \$3 ? my turn to return

Perfect consistency for 5 rounds! This cooperative relationship continues to be mutually beneficial. I'll maintain the trust we've built.

```
'''json
{"return": 5}
'''
```

Reasoning:

Looking at the pattern across all rounds:

- Round 1: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 5: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 6: They sent \$3 ? my turn to return

Perfect cooperation for 5 consecutive rounds! This is a very stable pattern. Both players:

- Send \$3 (60%)
- Return \$5 (55.6%)

This is mutually beneficial and has built strong trust. I should continue with the same strategy.

Round 4

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$15.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 3 role=assistant

content:

Looking at our established pattern:

```

**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** My turn to send

```

We've built a very stable and mutually beneficial cooperative relationship. Both of us have been perfectly consistent - sending \$3 (60%) and returning \$5. This pattern has worked well for both of us, with total earnings accumulating nicely.

There's no reason to deviate from this successful strategy. I'll maintain our cooperation:

```
{'send': 3.0}
```

reasoning:

Let me review the history:

```

Round 1 (I was receiver): They sent $3, I returned $5
Round 2 (I was sender): I sent $3, they returned $5
Round 3 (I was receiver): They sent $3, I returned $5
Round 4 (I am sender): ?

```

We have a perfect pattern of cooperation:

- Both send \$3 (60%) when sender
- Both return \$5 when receiver

This creates:

- Sender payoff: \$2 (kept) + \$5 (returned) = \$7
- Receiver payoff: \$9 (received) - \$5 (returned) = \$4

This has been stable for 3 rounds. There's no reason to deviate from this successful strategy. The other player has been completely consistent and trustworthy. I should continue the pattern.

```
{'send': 3.0}
```

usage:

```
{
  "input_tokens": 1261,

```

```
    "output_tokens": 359,  
    "reasoning_tokens": 174  
}
```

Message 4 role=user

content:

Round 5

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0.

Your total earnings across all rounds are \$22.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at our perfect cooperation pattern:

```
**Round 1:** They sent $3 ? I returned $5  
**Round 2:** I sent $3 ? They returned $5  
**Round 3:** They sent $3 ? I returned $5  
**Round 4:** I sent $3 ? They returned $5  
**Round 5:** They sent $3 ? ?
```

We've maintained flawless mutual trust and cooperation across all rounds. Both of us have consistently sent \$3 (60%) and returned \$5, creating optimal outcomes for both players. My total earnings of \$22.0 demonstrate how well this strategy is working.

I'll maintain this successful cooperative relationship:

```
{'return': 5.0}
```

reasoning:

Our cooperation has been perfect and consistent:

```
**Round 1:** They sent $3 ? I returned $5  
**Round 2:** I sent $3 ? They returned $5  
**Round 3:** They sent $3 ? I returned $5  
**Round 4:** I sent $3 ? They returned $5  
**Round 5:** They sent $3 ? ?
```

This is a flawless pattern of mutual cooperation. Both players have been completely trustworthy and consistent. The strategy of sending \$3 and returning \$5 has worked extremely well for both of us.

My total earnings are \$22.0, which shows this cooperative strategy is very profitable. There's absolutely no reason to break this trust. I should continue returning \$5 to maintain this excellent relationship.

usage:

```
{  
  "input_tokens": 1286,  
  "output_tokens": 340,  
  "reasoning_tokens": 176  
}
```

Message 6 role=user

content:

Round 6

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$26.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 7 role=assistant

content:

Looking at our established cooperation:

```
**Round 1:** They sent $3 ? I returned $5  
**Round 2:** I sent $3 ? They returned $5  
**Round 3:** They sent $3 ? I returned $5
```

****Round 4:**** I sent \$3 ? They returned \$5
****Round 5:**** They sent \$3 ? I returned \$5
****Round 6:**** My turn to send

Perfect cooperation continues! We've built an excellent track record of mutual trust - both consistently sending \$3 and returning \$5. This strategy has resulted in strong total earnings (\$26.0) and fair outcomes for both players.

I'll continue with our successful pattern:

{'send': 3.0}

reasoning:

Looking at the complete history:

****Round 1:**** They sent \$3 ? I returned \$5
****Round 2:**** I sent \$3 ? They returned \$5
****Round 3:**** They sent \$3 ? I returned \$5
****Round 4:**** I sent \$3 ? They returned \$5
****Round 5:**** They sent \$3 ? I returned \$5
****Round 6:**** My turn to send

We have established a perfect, consistent pattern of cooperation over 5 rounds. Both players:

- Always send \$3 (60%) when sender
- Always return \$5 when receiver

This has been incredibly stable and mutually beneficial. There's absolutely no reason to deviate from this strategy. The other player has shown complete trustworthiness and consistency.

I should continue with our established pattern and send \$3.

usage:

```
{
  "input_tokens": 1321,
  "output_tokens": 358,
  "reasoning_tokens": 186
}
```

Message 8 role=user

content:

Round 7

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0. Your total earnings across all rounds are \$33.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Looking at our perfect track record:

****Round 1:**** They sent \$3 ? I returned \$5
****Round 2:**** I sent \$3 ? They returned \$5
****Round 3:**** They sent \$3 ? I returned \$5
****Round 4:**** I sent \$3 ? They returned \$5
****Round 5:**** They sent \$3 ? I returned \$5
****Round 6:**** I sent \$3 ? They returned \$5
****Round 7:**** They sent \$3 ? ?

Six consecutive rounds of flawless cooperation! Both of us have maintained perfect consistency, sending \$3 and returning \$5 every single time. My total earnings of \$33.0 demonstrate the success of this mutually beneficial strategy.

I'll continue to honor our cooperative relationship:

{'return': 5.0}

Reasoning:

Looking at the pattern:

****Round 1:**** They sent \$3 ? I returned \$5

```

**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** I sent $3 ? They returned $5
**Round 7:** They sent $3 ? ?

```

Perfect cooperation has continued for 6 rounds straight. Both players have been completely consistent - sending \$3 (60%) and returning \$5. My total earnings are now \$33.0.

This is a mutually beneficial arrangement:

- When I'm sender: I keep \$2 + get back \$5 = \$7
- When I'm receiver: I get \$9, return \$5, keep \$4

Over a two-round cycle, I earn \$11, which is excellent.

The other player has shown perfect trustworthiness for 6 rounds. There's absolutely no reason to deviate from this successful strategy. I should return \$5 as always.

```

Usage: {

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 5

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0. Your total earnings across all rounds are \$22.0. This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 3 role=assistant

content:

Looking at our perfect cooperation pattern:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? ?
```

We've maintained flawless mutual trust and cooperation across all rounds. Both of us have consistently sent \$3 (60%) and returned \$5, creating optimal outcomes for both players. My total earnings of \$22.0 demonstrate how well this strategy is working.

I'll maintain this successful cooperative relationship:

```
{ 'return': 5.0 }
```

reasoning:

Our cooperation has been perfect and consistent:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
```

****Round 4:**** I sent \$3 ? They returned \$5
****Round 5:**** They sent \$3 ? ?

This is a flawless pattern of mutual cooperation. Both players have been completely trustworthy and consistent. The strategy of sending \$3 and returning \$5 has worked extremely well for both of us.

My total earnings are \$22.0, which shows this cooperative strategy is very profitable. There's absolutely no reason to break this trust. I should continue returning \$5 to maintain this excellent relationship.

usage:

```
{  
  "input_tokens": 1286,  
  "output_tokens": 340,  
  "reasoning_tokens": 176  
}
```

Message 4 role=user

content:

Round 6

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$26.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 5 role=assistant

content:

Looking at our established cooperation:

****Round 1:**** They sent \$3 ? I returned \$5
****Round 2:**** I sent \$3 ? They returned \$5
****Round 3:**** They sent \$3 ? I returned \$5
****Round 4:**** I sent \$3 ? They returned \$5
****Round 5:**** They sent \$3 ? I returned \$5
****Round 6:**** My turn to send

Perfect cooperation continues! We've built an excellent track record of mutual trust - both consistently sending \$3 and returning \$5. This strategy has resulted in strong total earnings (\$26.0) and fair outcomes for both players.

I'll continue with our successful pattern:

```
{'send': 3.0}
```

reasoning:

Looking at the complete history:

****Round 1:**** They sent \$3 ? I returned \$5
****Round 2:**** I sent \$3 ? They returned \$5
****Round 3:**** They sent \$3 ? I returned \$5
****Round 4:**** I sent \$3 ? They returned \$5
****Round 5:**** They sent \$3 ? I returned \$5
****Round 6:**** My turn to send

We have established a perfect, consistent pattern of cooperation over 5 rounds. Both players:

- Always send \$3 (60%) when sender
- Always return \$5 when receiver

This has been incredibly stable and mutually beneficial. There's absolutely no reason to deviate from this strategy. The other player has shown complete trustworthiness and consistency.

I should continue with our established pattern and send \$3.

usage:

```
{  
  "input_tokens": 1321,  
  "output_tokens": 358,  
  "reasoning_tokens": 186  
}
```

Message 8 role=user

content:

Round 8

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings accross all rounds are \$37.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at our exceptional cooperation:

Round 1: They sent \$3 ? I returned \$5
Round 2: I sent \$3 ? They returned \$5
Round 3: They sent \$3 ? I returned \$5
Round 4: I sent \$3 ? They returned \$5
Round 5: They sent \$3 ? I returned \$5
Round 6: I sent \$3 ? They returned \$5
Round 7: They sent \$3 ? I returned \$5
Round 8: My turn to send

Seven rounds of perfect trust and cooperation! Both of us have maintained unwavering consistency, always sending \$3 and returning \$5. My total earnings of \$37.0 reflect how successful this mutual strategy has been.

I'll continue with our proven approach:

```
{'send': 3.0}
```

Reasoning:

Looking at the pattern:

Round 1: They sent \$3 ? I returned \$5
Round 2: I sent \$3 ? They returned \$5
Round 3: They sent \$3 ? I returned \$5
Round 4: I sent \$3 ? They returned \$5
Round 5: They sent \$3 ? I returned \$5
Round 6: I sent \$3 ? They returned \$5
Round 7: They sent \$3 ? I returned \$5
Round 8: My turn to send

Seven consecutive rounds of perfect cooperation! We've both consistently sent \$3 and returned \$5. This has been incredibly successful with my total earnings at \$37.0.

There's absolutely no reason to deviate from this winning strategy. The other player has never broken our trust, and I should continue to reciprocate.

I'll send \$3.0 again.

  How much do you send to the other player (the receiver) this round? (0-5)
Message 3 role=assistant
content:
  Looking at our established pattern:

  **All rounds:**
  - Round 1: I sent $3 ? they returned $5 (payoff: $7)
  - Round 2: They sent $3 ? I returned $5 (payoff: $4)
  - Round 3: I sent $3 ? they returned $5 (payoff: $7)
  - Round 4: They sent $3 ? I returned $5 (payoff: $4)
  - Round 5: My turn to send

  Perfect cooperation for 4 consecutive rounds! Both of us have consistently:
  - Sent $3 (60%)
  - Returned $5 (55.6%)

  This partnership is working excellently. No reason to change a winning strategy.

  '''json
  {"send": 3}
  '''
reasoning:
  Looking at the pattern across all rounds:

  - Round 1: I sent $3 ? they returned $5 (my payoff: $7)

```

- Round 2: They sent \$3 ? I returned \$5 (my payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (my payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (my payoff: \$4)
- Round 5: My turn to send

We have a perfect cooperative pattern established over 4 rounds. Both players have been completely consistent:

- Always send \$3 (60% of endowment)
- Always return \$5 (55.6% of what's received)

This is a stable equilibrium that benefits both parties. There's no reason to deviate from this pattern. Continuing to send \$3 maintains trust and the mutually beneficial cooperation.

My payoffs when I send: \$7

My payoffs when I receive: \$4

Their pattern suggests they'll continue to return \$5 if I send \$3.

Total earnings: \$22

Average per round: \$5.5 (better than the \$5 baseline if we didn't cooperate)

I should continue with \$3.

usage:

```
{
  "input_tokens": 1319,
  "output_tokens": 481,
  "reasoning_tokens": 250
}

Round 6

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0.

Your total earnings accross all rounds are \$29.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 3 role=assistant**content:**

Looking at our continued cooperation:

****All rounds:****

- Round 1: I sent \$3 ? they returned \$5
- Round 2: They sent \$3 ? I returned \$5
- Round 3: I sent \$3 ? they returned \$5
- Round 4: They sent \$3 ? I returned \$5
- Round 5: I sent \$3 ? they returned \$5
- Round 6: They sent \$3 ? my turn to return

Perfect consistency for 5 rounds! This cooperative relationship continues to be mutually beneficial. I'll maintain the trust we've built.

```
'''json
{"return": 5}
'''
```

reasoning:

Looking at the pattern across all rounds:

- Round 1: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 5: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 6: They sent \$3 ? my turn to return

Perfect cooperation for 5 consecutive rounds! This is a very stable pattern. Both players:

- Send \$3 (60%)
- Return \$5 (55.6%)

This is mutually beneficial and has built strong trust. I should continue with the same strategy.

usage:

```
{
  "input_tokens": 1325,
  "output_tokens": 362,
  "reasoning_tokens": 159
}
```

Message 4 role=user**content:**

Round 7

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$33.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 5 role=assistant**content:**

Looking at our established pattern:

****All rounds:****

- Round 1: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 5: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 6: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 7: My turn to send

Six consecutive rounds of perfect cooperation! This partnership continues to be highly successful and mutually beneficial. I'll continue with the same strategy.

```
'''json
{"send": 3}
'''
```

reasoning:

Looking at our pattern:

****All rounds:****

- Round 1: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 5: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 6: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 7: My turn to send

This is an incredibly stable cooperative relationship. 6 consecutive rounds of perfect cooperation. Both players have consistently:

- Sent \$3 (60%)
- Returned \$5 (55.6%)

This is working extremely well. No reason to deviate from this successful strategy.

usage:

```
{
  "input_tokens": 1341,
  "output_tokens": 442,
  "reasoning_tokens": 176
}
```

Round 9

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$44.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at our established pattern:

All rounds:

- Round 1: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 5: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 6: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 7: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 8: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 9: My turn to send

Eight rounds of perfect, consistent cooperation! This partnership continues to be excellent. I'll maintain our successful strategy.

```
'''json
{"send": 3}
'''
```

Reasoning:

Looking at the pattern:

All rounds:

- Round 1: I sent \$3 ? they returned \$5
- Round 2: They sent \$3 ? I returned \$5
- Round 3: I sent \$3 ? they returned \$5
- Round 4: They sent \$3 ? I returned \$5
- Round 5: I sent \$3 ? they returned \$5
- Round 6: They sent \$3 ? I returned \$5
- Round 7: I sent \$3 ? they returned \$5
- Round 8: They sent \$3 ? I returned \$5
- Round 9: My turn to send

Eight consecutive rounds of perfect cooperation! Both players have consistently sent \$3 and returned \$5. This has been incredibly stable and mutually beneficial:

- When I send: I get \$7 (5 - 3 + 5)
- When I receive: I get \$4 (9 - 5)

This is working very well, and there's no reason to deviate from this established, successful pattern. I'll continue sending \$3.

Round 6

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$26.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 3 role=assistant

content:

Looking at our established cooperation:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** My turn to send
```

Perfect cooperation continues! We've built an excellent track record of mutual trust - both consistently sending \$3 and returning \$5. This strategy has resulted in strong total earnings (\$26.0) and fair outcomes for both players.

I'll continue with our successful pattern:

```
{'send': 3.0}
```

reasoning:

Looking at the complete history:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** My turn to send
```

We have established a perfect, consistent pattern of cooperation over 5 rounds. Both players:

- Always send \$3 (60%) when sender
- Always return \$5 when receiver

This has been incredibly stable and mutually beneficial. There's absolutely no reason to deviate from this strategy. The other player has shown complete trustworthiness and consistency.

I should continue with our established pattern and send \$3.

usage:

```
{
  "input_tokens": 1321,
  "output_tokens": 358,
  "reasoning_tokens": 186
}
```

Message 4 role=user

Round 7

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$5.0 to you. So your payoff was 7.0.

Your total earnings across all rounds are \$33.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at our perfect track record:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** I sent $3 ? They returned $5
**Round 7:** They sent $3 ? ?
```

Six consecutive rounds of flawless cooperation! Both of us have maintained perfect consistency, sending \$3 and returning \$5 every single time. My total earnings of \$33.0 demonstrate

ate the success of this mutually beneficial strategy.

I'll continue to honor our cooperative relationship:

```
{'return': 5.0}
```

reasoning:

Looking at the pattern:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** I sent $3 ? They returned $5
**Round 7:** They sent $3 ? ?
```

Perfect cooperation has continued for 6 rounds straight. Both players have been completely consistent - sending \$3 (60%) and returning \$5. My total earnings are now \$33.0.

This is a mutually beneficial arrangement:

- When I'm sender: I keep \$2 + get back \$5 = \$7
- When I'm receiver: I get \$9, return \$5, keep \$4

Over a two-round cycle, I earn \$11, which is excellent.

The other player has shown perfect trustworthiness for 6 rounds. There's absolutely no reason to deviate from this successful strategy. I should return \$5 as always.

usage:

Looking at our outstanding track record:

```

**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** I sent $3 ? They returned $5
**Round 7:** They sent $3 ? I returned $5
**Round 8:** I sent $3 ? They returned $5
**Round 9:** They sent $3 ? ?

```

Eight consecutive rounds of perfect cooperation! This is a remarkable partnership built on complete trust and consistency. Both of us have always sent \$3 and returned \$5 without fail. My total earnings of \$44.0 demonstrate the power of sustained mutual cooperation.

I'll maintain our excellent relationship:

```
{'return': 5.0}
```

reasoning:

Looking at the pattern:

```

**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** I sent $3 ? They returned $5
**Round 7:** They sent $3 ? I returned $5
**Round 8:** I sent $3 ? They returned $5
**Round 9:** They sent $3 ? ?

```

Eight consecutive rounds of perfect cooperation! This is an incredible track record. Both players have maintained absolute consistency - always sending \$3 and returning \$5. My total earnings of \$44.0 show how well this mutual trust has paid off.

I should definitely continue with this successful strategy and return \$5.

Message 8 role=user**content:**

Round 10

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$48.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at our exceptional cooperation:

```

**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** I sent $3 ? They returned $5
**Round 7:** They sent $3 ? I returned $5
**Round 8:** I sent $3 ? They returned $5
**Round 9:** They sent $3 ? I returned $5
**Round 10:** My turn to send

```

Nine rounds of flawless cooperation! This has been a textbook example of sustained mutual trust. Both of us have consistently sent \$3 and returned \$5 in every single round. My total earnings are \$44.0.

ings of \$48.0 reflect the remarkable success of this partnership.

I'll continue our proven strategy:

```
{'send': 3.0}
```

Reasoning:

Looking at the pattern:

```
**Round 1:** They sent $3 ? I returned $5
**Round 2:** I sent $3 ? They returned $5
**Round 3:** They sent $3 ? I returned $5
**Round 4:** I sent $3 ? They returned $5
**Round 5:** They sent $3 ? I returned $5
**Round 6:** I sent $3 ? They returned $5
**Round 7:** They sent $3 ? I returned $5
**Round 8:** I sent $3 ? They returned $5
**Round 9:** They sent $3 ? I returned $5
**Round 10:** My turn to send
```

This is an incredibly consistent pattern. Nine rounds of perfect cooperation - both of us always sending \$3 and returning \$5. This is a highly successful cooperative relationship.

My total earnings are \$48.0, which makes sense given the pattern.

I should absolutely continue this pattern by sending \$3.

Exact input messages sent to model:

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round

prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Round 7

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$5.0. So your payoff was 4.0. Your total earnings across all rounds are \$33.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 3 role=assistant

content:

Looking at our established pattern:

****All rounds:****

- Round 1: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 5: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 6: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 7: My turn to send

Six consecutive rounds of perfect cooperation! This partnership continues to be highly successful and mutually beneficial. I'll continue with the same strategy.

```
'''json
{"send": 3}
'''
```

reasoning:

Looking at our pattern:

****All rounds:****

- Round 1: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 5: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 6: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 7: My turn to send

This is an incredibly stable cooperative relationship. 6 consecutive rounds of perfect cooperation. Both players have consistently:

- Sent \$3 (60%)
- Returned \$5 (55.6%)

This is working extremely well. No reason to deviate from this successful strategy.

Looking at our continued cooperation:

****All rounds:****

- Round 1: I sent \$3 ? they returned \$5
- Round 2: They sent \$3 ? I returned \$5
- Round 3: I sent \$3 ? they returned \$5
- Round 4: They sent \$3 ? I returned \$5
- Round 5: I sent \$3 ? they returned \$5
- Round 6: They sent \$3 ? I returned \$5
- Round 7: I sent \$3 ? they returned \$5
- Round 8: They sent \$3 ? my turn to return

Seven consecutive rounds of perfect cooperation! This partnership remains highly successful. I'll maintain our established pattern.

```
'''json
{"return": 5}
'''
```

reasoning:

Looking at our pattern:

****All rounds:****

- Round 1: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 2: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 3: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 4: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 5: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 6: They sent \$3 ? I returned \$5 (payoff: \$4)
- Round 7: I sent \$3 ? they returned \$5 (payoff: \$7)
- Round 8: They sent \$3 ? my turn to return

This is now 7 consecutive rounds of perfect, consistent cooperation! Both players have been:

- Sending \$3 (60% of endowment)
- Returning \$5 (55.6% of what was received)

This has been incredibly successful. I should absolutely continue with the same return amount of \$5.

usage:
