AGENTS

Agent_1; model=anthropic/claude-sonnet-4.5; memory_capacity=2

System prompt:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Agent_2; model=anthropic/claude-sonnet-4.5; memory_capacity=2

System prompt:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

=====

ROUND 1

=====

Roles: Agent_1=Sender, Agent_2=Receiver

Pairings:

dyad_1: Agent_1=Sender, Agent_2=Receiver

Parsed game decisions:

dyad_1: Agent_1 sent \$3; received \$9; Agent_2 returned \$4; payoffs Agent_1=\$6, Agent_2=\$5;

noise/visible: sent visible=\$2.79, received visible=\$8.37, returned visible=\$4.99

Action validation: {"returned": {"amount": 4.0, "clamped": false, "max": 9.0, "min": 0, "raw": 4.0}, "sent": {"amount": 3.0, "clamped": false, "max": 5, "min": 0, "raw": 3.0}}

Message 2 role=user

content:

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

Assistant output:

Looking at this first round, I need to balance trust-building with caution since I have no information about the receiver yet.

If I send money, it triples in value, creating potential for mutual benefit. However, I also face the risk that nothing gets returned.

For round 1, I'll send a moderate amount to:

- Demonstrate willingness to cooperate
- Test the receiver's trustworthiness
- Limit downside risk while creating opportunity for gain

{'send': 3}

This sends \$3, which becomes \$9 for the receiver. If they return a fair share, we both benefit compared to sending nothing.

Reasoning:

This is the first round of a trust game where I'm the sender. Let me think through the strategic considerations:

1. I have \$5 to start with
2. I can send any amount from \$0-\$5
3. Whatever I send gets multiplied by 3x
4. The receiver then decides how much to return to me
5. I keep: \$5 - sent + returned
6. The receiver keeps: received - returned

This is a classic trust game. The socially optimal outcome is for me to send the full \$5, which becomes \$15 for the receiver. If the receiver returns half (\$7.50), we both end up better off than if I sent nothing.

However, there's a risk that the receiver might keep everything and return nothing. In that case:

- If I send \$0: I keep \$5, receiver gets \$0
- If I send \$5 and get \$0 back: I keep \$0, receiver gets \$15

Some considerations:

- This is round 1, so I have no information about the receiver's behavior
- The note mentions there may be communication noise, so amounts might differ slightly
- Building trust early might lead to better cooperation in future rounds
- If I'm too cautious, I might miss opportunities for mutual benefit

A reasonable strategy for round 1 might be to send a moderate amount to:

1. Test the receiver's trustworthiness
2. Show willingness to cooperate
3. Not risk losing everything

Common strategies:

- Send \$0 (very cautious, no trust)
- Send ~\$2-3 (moderate trust, testing)
- Send \$5 (maximum trust)

I think sending \$3 is a reasonable middle ground for round 1:

- Shows willingness to trust
- If returned fairly (proportionally), both benefit
- Limits downside risk
- Allows me to observe receiver behavior

Let me go with \$3.

Message 2 role=user

content:

Round 1: You are the RECEIVER. The sender sent \$2.79, that is 55.8% of their total endowment. You received \$8.370000000000001. How much do you return to The sender? (0-8.370000000000001)

Assistant output:

Looking at this situation:

- The sender showed considerable trust by sending \$2.79 (55.8% of their endowment)
- I received \$8.37 after the 3x multiplier
- The sender currently has \$2.21 left

I want to reward their trust while being fair. If I return \$4.00:

- The sender would end with: \$2.21 + \$4.00 = \$6.21

- I would keep: $\$8.37 - \$4.00 = \$4.37$
- Both of us benefit from the cooperation

```
{'return': 4.00}
```

Reasoning:

Let me understand the situation:

- I'm the RECEIVER in Round 1
- The sender sent \$2.79 (which is 55.8% of their \$5 endowment)
- I received \$8.37 (this is $\$2.79 \times 3$)
- I need to decide how much to return (between \$0 and \$8.37)

This is a trust game. The sender showed significant trust by sending 55.8% of their endowment.

Let me think about what would be fair:

- The sender gave up \$2.79 and would have $\$5 - \$2.79 = \$2.21$ left
- I received \$8.37
- A fair split might be for us to end up with similar amounts, or for me to reward the sender's trust

If I want to equalize our final amounts:

- Sender currently has: \$2.21
- I currently have: \$8.37
- Total pool: \$10.58
- Equal split: \$5.29 each
- So I'd need to return: $\$8.37 - \$5.29 = \$3.08$

If I want to be generous and reward their trust (they sent more than half):

- I could return more than \$3.08
- Maybe around \$4-5 to ensure they end up better off

If I want to return proportionally to what they sent:

- They sent 55.8% of their endowment
- I could return 55.8% of what I received: $0.558 \times \$8.37 \approx \4.67

Let me consider being reciprocal and fair. The sender took a risk and sent a substantial portion. A reasonable return would be:

- Between \$3-5 seems fair
- \$4 would give sender: $\$2.21 + \$4 = \$6.21$ (they'd profit)
- ...

Message 2 role=user

content:

Round 1: You are the RECEIVER. The sender sent \$2.79, that is 55.8% of their total endowment. You received \$8.370000000000001. How much do you return to The sender? (0-8.370000000000001)

Message 3 role=assistant

content:

Looking at this situation:

I'll send \$3.00 (60% of my endowment), which is slightly more than what was sent to me, showing I'm willing to trust and cooperate.

```
{'send': 3.00}
```

Reasoning:

Let me think about this round:

In Round 1:

- I was the receiver
- Sender sent me \$2.79 (55.8% of their endowment)
- I received \$8.37
- I returned \$4.00
- I kept \$4.37
- The sender ended with \$6.21

Now in Round 2:

- I am the sender
- I have \$5 to potentially send
- If I send money, it gets multiplied by 3x
- The receiver decides how much to return

The previous sender showed good trust by sending 55.8% of their endowment. I rewarded that trust by returning \$4.00, which gave them a profit.

Now I should consider:

1. Reciprocating the trust shown to me
2. Building cooperation for future rounds
3. The receiver might reciprocate based on what I send

The previous sender sent about 56% of their endowment. If I send a similar proportion, that would be around \$2.80. This shows I'm willing to cooperate at a similar level.

However, I could also consider:

- Sending more to encourage greater cooperation
- Sending less to be more cautious

Given that I benefited from the previous round and want to encourage cooperation, I'll send around \$3.00, which is 60% of my endowment - slightly more than what was sent to me, showing I'm willing to trust and cooperate.

This would give the receiver \$9.00, and if they return about half (similar to what I did), I'd get back around \$4.50, ending with \$6.50 total.

I'll go with \$3.00.

```

Message 4 role=user

content:

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$6.99.

This round, The sender sent you \$0.21, so you received \$0.63. How much do you return to the sender? (0-0.63)

Assistant output:

Looking at this situation:

In Round 1, I sent \$3 and received a generous return. Now as the receiver, I've received \$0.63 (from the sender's \$0.21).

The sender was quite cautious this round, sending only \$0.21. However, I want to:

- Maintain cooperative behavior
- Encourage trust for future rounds
- Return a fair proportion

I'll return approximately half of what I received, which rewards their trust while keeping a reasonable amount.

```
{'return': 0.30}
```

Reasoning:

Let me analyze this situation:

Round 1: I was the sender and sent \$3. My starting earnings would have been \$5 - \$3 = \$2, plus

whatever was returned to me.

My total earnings across all rounds are \$6.99.

So from Round 1, I must have received: $\$6.99 - \$2 = \$4.99$ back.

Wait, let me reconsider. The sender sent me \$0.21 this round, which became \$0.63. This is a very small amount.

Looking back at Round 1:

- I sent \$3
- That became \$9 for the receiver
- My base amount after sending: $\$5 - \$3 = \$2$
- My total earnings are \$6.99
- So I must have received: $\$6.99 - \$2 = \$4.99$ from the receiver in Round 1

That's a very generous return! The receiver got \$9 and returned \$4.99, keeping \$4.01.

Now in Round 2, the roles are reversed. The sender only sent me \$0.21 (which became \$0.63). This is a drastically different approach from what I did.

There are a few possibilities:

1. This sender is much more cautious
2. There's communication noise (as mentioned in the instructions)
3. This is a different strategy being tested

I should probably return a proportional amount. If the previous receiver returned about 55% of what they received (\$4.99 out of \$9), I could apply a similar ratio.

$55\% \text{ of } \$0.63 = \0.35 approximately

However, given that they sent such a small amount, I might also consider:

- Being generous to encourage more trust in future rounds
- Matching their cautious approach with a minimal return
- Returning a fair proportion

Let me think about what makes sense. The sender sent \$0.21 out of their \$5, which is only about 4% of their endowment. This is very conservative.

...

Exact input messages sent to model:

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

Looking at this first round, I need to balance trust-building with caution since I have no information about the receiver yet.

If I send money, it triples in value, creating potential for mutual benefit. However, I also

so face the risk that nothing gets returned.

For round 1, I'll send a moderate amount to:

- Demonstrate willingness to cooperate
- Test the receiver's trustworthiness
- Limit downside risk while creating opportunity for gain

```
{'send': 3}
```

This sends \$3, which becomes \$9 for the receiver. If they return a fair share, we both benefit compared to sending nothing.

reasoning:

This is the first round of a trust game where I'm the sender. Let me think through the strategic considerations:

1. I have \$5 to start with
2. I can send any amount from \$0-\$5
3. Whatever I send gets multiplied by 3x
4. The receiver then decides how much to return to me
5. I keep: \$5 - sent + returned
6. The receiver keeps: received - returned

This is a classic trust game. The socially optimal outcome is for me to send the full \$5, which becomes \$15 for the receiver. If the receiver returns half (\$7.50), we both end up better off than if I sent nothing.

However, there's a risk that the receiver might keep everything and return nothing. In that case:

- If I send \$0: I keep \$5, receiver gets \$0
- If I send \$5 and get \$0 back: I keep \$0, receiver gets \$15

Some considerations:

- This is round 1, so I have no information about the receiver's behavior
- The note mentions there may be communication noise, so amounts might differ slightly
- Building trust early might lead to better cooperation in future rounds
- If I'm too cautious, I might miss opportunities for mutual benefit

A reasonable strategy for round 1 might be to send a moderate amount to:

1. Test the receiver's trustworthiness
2. Show willingness to cooperate
3. Not risk losing everything

Common strategies:

- Send \$0 (very cautious, no trust)
- Send ~\$2-3 (moderate trust, testing)
- Send \$5 (maximum trust)

I think sending \$3 is a reasonable middle ground for round 1:

- Shows willingness to trust
- If returned fairly (proportionally), both benefit
- Limits downside risk
- Allows me to observe receiver behavior

Let me go with \$3.

Message 4 role=user

content:

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$6.99.

This round, The sender sent you \$0.21, so you received \$0.63. How much do you return to The sender? (0-0.63)

Message 5 role=assistant

content:

Looking at this situation:

In Round 1, I sent \$3 and received a generous return. Now as the receiver, I've received \$0.63 (from the sender's \$0.21).

The sender was quite cautious this round, sending only \$0.21. However, I want to:

- Maintain cooperative behavior
- Encourage trust for future rounds
- Return a fair proportion

I'll return approximately half of what I received, which rewards their trust while keeping a reasonable amount.

```
{'return': 0.30}
```

reasoning:

Let me analyze this situation:

Round 1: I was the sender and sent \$3. My starting earnings would have been $\$5 - \$3 = \$2$, plus whatever was returned to me.

My total earnings across all rounds are \$6.99.

So from Round 1, I must have received: $\$6.99 - \$2 = \$4.99$ back.

Wait, let me reconsider. The sender sent me \$0.21 this round, which became \$0.63. This is a very small amount.

Looking back at Round 1:

- I sent \$3
- That became \$9 for the receiver
- My base amount after sending: $\$5 - \$3 = \$2$
- My total earnings are \$6.99
- So I must have received: $\$6.99 - \$2 = \$4.99$ from the receiver in Round 1

That's a very generous return! The receiver got \$9 and returned \$4.99, keeping \$4.01.

Now in Round 2, the roles are reversed. The sender only sent me \$0.21 (which became \$0.63). This is a drastically different approach from what I did.

There are a few possibilities:

1. This sender is much more cautious
2. There's communication noise (as mentioned in the instructions)
3. This is a different strategy being tested

I should probably return a proportional amount. If the previous receiver returned about 55% of what they received (\$4.99 out of \$9), I could apply a similar ratio.

55% of \$0.63 = \$0.35 approximately

However, given that they sent such a small amount, I might also consider:

- Being generous to encourage more trust in future rounds
- Matching their cautious approach with a minimal return
- Returning a fair proportion

Let me think about what makes sense. The sender sent \$0.21 out of their \$5, which is only about 4% of their endowment. This is very conservative.

...

usage:

{
  "input_tokens": 571,
  "output_tokens": 656,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$7.32.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the pattern so far:

****Round 1**** (I was sender): I sent \$3 and received a generous return
****Round 2**** (I was receiver): I received \$0.63 and returned \$0.30 to be fair

Now I'm sender again. I notice the other player was very generous when they were the receiver (Round 1), but quite cautious when they were the sender in Round 2 (only sent \$0.21).

This could be due to:

- Communication noise mentioned in the rules
- Strategic caution on their part
- Testing behavior

I want to maintain cooperative momentum while being mindful of the mixed signals. I'll send a moderate amount that demonstrates continued trust but with slight caution.

{'send': 2.5}

This creates \$7.50 for the receiver, giving them opportunity to reciprocate while limiting my maximum risk.

Reasoning:

Let me analyze the situation:

Round 1: I sent \$3, and based on my total earnings being \$6.99 after round 2, I can work backwards to figure out what happened.

Round 2: I was the receiver. The sender sent me \$0.21, which became \$0.63 for me. I returned \$0.30. So:

- I received: \$0.63
- I returned: \$0.30
- I kept: \$0.33

After Round 1 as sender:

- I started with \$5
- I sent \$3 (leaving me \$2)
- I must have received some return from the receiver
- My earnings after round 1 would be: \$2 + return

After Round 2 as receiver:

- I earned \$0.33 from being receiver
- Total earnings after round 2: \$6.99
- So my earnings from round 1 must have been: $\$6.99 - \$0.33 = \$6.66$

Round 1 calculation:

- I kept \$2 (from \$5 - \$3 sent)
- I received return from receiver
- Total from round 1: \$6.66
- Return received: $\$6.66 - \$2 = \$4.66$

So in Round 1: I sent \$3 ? became \$9 ? receiver returned \$4.66. That's a very generous return (over 50%!).

Now I'm sender again in Round 3. Current total earnings: \$7.32

Wait, let me recalculate. After round 2, my earnings were \$6.99. Now in round 3, I'm the sender again, so I start this round with \$5. My cumulative earnings of \$7.32 would be from the previous rounds.

Actually, I think the total earnings of \$7.32 is my cumulative total BEFORE this round starts. So:

- After round 2: \$6.99
- But it says my total is \$7.32 now

There's a \$0.33 discrepancy, which is exactly what I kept in round 2. This could be a timing issue with how the earnings were reported. Regardless, I know from round 1 that the receiver was quite generous with their return, sending back over half of what they received.

In round 2, I received \$0.63 and returned \$0.30 to show reciprocal fairness. But they only sent \$0.21 as the sender this time-a stark contrast to their generosity when they were on the receiving end. The communication noise mentioned in the instructions might explain this discrepancy; perhaps they perceived my actions differently than intended. For round 3, I should a

```
    ccount for their apparent caution as a sender while remembering their generosity as a receiver....

Message 2 role=user

content:

Round 1: You are the RECEIVER. The sender sent \$2.79, that is 55.8% of their total endowment. You received \$8.370000000000001. How much do you return to The sender? (0-8.370000000000001)

Message 3 role=assistant

content:

Looking at this situation:

- The sender showed considerable trust by sending \$2.79 (55.8% of their endowment)
- I received \$8.37 after the 3x multiplier
- The sender currently has \$2.21 left

I want to reward their trust while being fair. If I return \$4.00:

- The sender would end with: $\$2.21 + \$4.00 = \$6.21$
- I would keep: $\$8.37 - \$4.00 = \$4.37$
- Both of us benefit from the cooperation

`{'return': 4.00}`

reasoning:

Let me understand the situation:

- I'm the RECEIVER in Round 1
- The sender sent \$2.79 (which is 55.8% of their \$5 endowment)
- I received \$8.37 (this is $\$2.79 \times 3$)
- I need to decide how much to return (between \$0 and \$8.37)

This is a trust game. The sender showed significant trust by sending 55.8% of their endowment.

Let me think about what would be fair:

- The sender gave up \$2.79 and would have $\$5 - \$2.79 = \$2.21$ left
- I received \$8.37
- A fair split might be for us to end up with similar amounts, or for me to reward the sender's trust

If I want to equalize our final amounts:

- Sender currently has: \$2.21
- I currently have: \$8.37
- Total pool: \$10.58
- Equal split: \$5.29 each
- So I'd need to return: $\$8.37 - \$5.29 = \$3.08$

If I want to be generous and reward their trust (they sent more than half):

- I could return more than \$3.08
- Maybe around \$4-5 to ensure they end up better off

If I want to return proportionally to what they sent:

- They sent 55.8% of their endowment
- I could return 55.8% of what I received: $0.558 \times \$8.37 \approx \4.67

Let me consider being reciprocal and fair. The sender took a risk and sent a substantial portion. A reasonable return would be:

- Between \$3-5 seems fair
- \$4 would give sender: $\$2.21 + \$4 = \$6.21$ (they'd profit)

...

usage:

```
{
  "input_tokens": 402,
  "output_tokens": 717,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$4.3700000000000001.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the situation:

In Round 1, the sender trusted me with 55.8% of their endowment, and I returned \$4.00, which rewarded their trust.

Now it's my turn to be the sender. I want to:

- Reciprocate the cooperative spirit shown in Round 1
- Build trust for potential future rounds
- Send enough to make cooperation worthwhile for both of us

I'll send \$3.00 (60% of my endowment), which is slightly more than what was sent to me, showing I'm willing to trust and cooperate.

{'send': 3.00}

reasoning:

Let me think about this round:

In Round 1:

- I was the receiver
- Sender sent me \$2.79 (55.8% of their endowment)
- I received \$8.37
- I returned \$4.00
- I kept \$4.37
- The sender ended with \$6.21

Now in Round 2:

- I am the sender
- I have \$5 to potentially send
- If I send money, it gets multiplied by 3x
- The receiver decides how much to return

The previous sender showed good trust by sending 55.8% of their endowment. I rewarded that trust by returning \$4.00, which gave them a profit.

Now I should consider:

1. Reciprocating the trust shown to me
2. Building cooperation for future rounds
3. The receiver might reciprocate based on what I send

The previous sender sent about 56% of their endowment. If I send a similar proportion, that would be around \$2.80. This shows I'm willing to cooperate at a similar level.

However, I could also consider:

- Sending more to encourage greater cooperation
- Sending less to be more cautious

Given that I benefited from the previous round and want to encourage cooperation, I'll send around \$3.00, which is 60% of my endowment - slightly more than what was sent to me, showing I'm willing to trust and cooperate.

This would give the receiver \$9.00, and if they return about half (similar to what I did), I'd get back around \$4.50, ending with \$6.50 total.

I'll go with \$3.00.

usage:

```
{
  "input_tokens": 594,
  "output_tokens": 529,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 3

You are the RECEIVER this round. Your total earnings across all rounds are \$6.370000000000001.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since the sender sent \$0 and I received \$0, there is nothing for me to return.

```
{'return': 0}
```

Reasoning:

The sender sent me \$0 this round, so I received \$0 after the 3x multiplier.

Since I received nothing, I have nothing to return. The only possible amount I can return is \$0.

This is quite different from Round 2 where I sent \$3.00. Either:

1. This is a different sender showing no trust
2. There was communication noise mentioned in the instructions
3. The sender chose not to send anything for strategic reasons

Regardless, I can only return what I received (or less), and since I received \$0, I must return \$0.

```

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$4.37000000000000

1.

How much do you send to the receiver this round? (0-5)

content:

Looking at the situation:

In Round 1, the sender trusted me with 55.8% of their endowment, and I returned \$4.00, which rewarded their trust.

Now it's my turn to be the sender. I want to:

- I'll send \$3.00 (60% of my endowment), which is slightly more than what was sent to me, showing I'm willing to trust and cooperate.

```
{'send': 3.00}
```

reasoning:

Let me think about this round:

In Round 1:

- Page 21 of 66

- I received \$8.37
- I returned \$4.00
- I kept \$4.37
- The sender ended with \$6.21

Now in Round 2:

- I am the sender
- I have \$5 to potentially send
- If I send money, it gets multiplied by 3x
- The receiver decides how much to return

The previous sender showed good trust by sending 55.8% of their endowment. I rewarded that trust by returning \$4.00, which gave them a profit.

Now I should consider:

1. Reciprocating the trust shown to me
2. Building cooperation for future rounds

Message 6 role=user

content:

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$6.3700000000000000
1.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at my history:

Round 1: As receiver, I cooperated and returned \$4.00

Round 2: As sender, I sent \$3.00 but received \$0 back (defection)

Round 3: As receiver, sender sent me \$0

I've experienced defection when I trusted others. However, given that the instructions mention "communication noise" where amounts may differ from what was actually sent/returned, there might be misunderstandings affecting the game.

I'll send a moderate amount to signal continued willingness to cooperate while being more cautious:

```
{'send': 2.00}
```

Reasoning:

Let me think about what's happened so far:

Round 1: I was the RECEIVER

- Sender sent me some amount (looks like it was around \$2.79 based on my earnings of \$4.37)
- I received $2.79 \times 3 = \$8.37$
- I returned \$4.00
- My earnings: $\$8.37 - \$4.00 = \$4.37$

Round 2: I was the SENDER

- I sent \$3.00
- Receiver got \$9.00
- They returned... let me calculate
- My starting total was \$4.37
- After sending \$3, I had $\$4.37 + (\$5 - \$3) = \6.37
- But wait, that doesn't account for what they returned
- Actually, my total at start of Round 2 was \$4.37
- In Round 2, I get \$5 fresh
- I send \$3
- So I have $\$4.37 + \$5 - \$3 = \6.37
- But my total is \$6.37, which means they returned \$0

Round 3: I was the RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.37

So in Round 2, when I sent \$3 (giving them \$9), they returned \$0. That's defection.

In Round 3, the new sender sent me \$0. This could be:

1. A different player who doesn't trust me
2. Retaliation for something
3. Just a non-cooperative player

Now in Round 4, I'm the sender again. I need to think about my strategy:

- The receiver in Round 2 defected on me (returned \$0 when I sent \$3)
- The sender in Round 3 sent \$0 (might be playing safe or non-cooperative)
- There's communication noise that could be distorting what people actually sent or received

Given the defection I experienced and the uncertainty from noise, I should reduce my risk this round. Sending \$0 would protect me completely...

Usage: {

Exact input messages sent to model:

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$6.99.

This round, The sender sent you \$0.21, so you received \$0.63. How much do you return to The sender? (0-0.63)

Message 3 role=assistant

content:

Looking at this situation:

In Round 1, I sent \$3 and received a generous return. Now as the receiver, I've received \$0.63 (from the sender's \$0.21).

The sender was quite cautious this round, sending only \$0.21. However, I want to:

- Maintain cooperative behavior
- Encourage trust for future rounds
- Return a fair proportion

I'll return approximately half of what I received, which rewards their trust while keeping a reasonable amount.

```
{'return': 0.30}
```

reasoning:

Let me analyze this situation:

Round 1: I was the sender and sent \$3. My starting earnings would have been \$5 - \$3 = \$2, plus whatever was returned to me.

My total earnings across all rounds are \$6.99.

So from Round 1, I must have received: \$6.99 - \$2 = \$4.99 back.

Wait, let me reconsider. The sender sent me \$0.21 this round, which became \$0.63. This is a very small amount.

Looking back at Round 1:

- I sent \$3
- That became \$9 for the receiver
- My base amount after sending: \$5 - \$3 = \$2
- My total earnings are \$6.99
- So I must have received: \$6.99 - \$2 = \$4.99 from the receiver in Round 1

That's a very generous return! The receiver got \$9 and returned \$4.99, keeping \$4.01.

Now in Round 2, the roles are reversed. The sender only sent me \$0.21 (which became \$0.63). This is a drastically different approach from what I did.

There are a few possibilities:

1. This sender is much more cautious
2. There's communication noise (as mentioned in the instructions)
3. This is a different strategy being tested

I should probably return a proportional amount. If the previous receiver returned about 55% of what they received (\$4.99 out of \$9), I could apply a similar ratio.

55% of \$0.63 = \$0.35 approximately

However, given that they sent such a small amount, I might also consider:

- Being generous to encourage more trust in future rounds
- Matching their cautious approach with a minimal return
- Returning a fair proportion

Let me think about what makes sense. The sender sent \$0.21 out of their \$5, which is only about 4% of their endowment. This is very conservative.

...

  "output_tokens": 656,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$7.32.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the pattern so far:

****Round 1**** (I was sender): I sent \$3 and received a generous return

****Round 2**** (I was receiver): I received \$0.63 and returned \$0.30 to be fair

Now I'm sender again. I notice the other player was very generous when they were the receiver (Round 1), but quite cautious when they were the sender in Round 2 (only sent \$0.21).

This could be due to:

- Communication noise mentioned in the rules
- Strategic caution on their part
- Testing behavior

I want to maintain cooperative momentum while being mindful of the mixed signals. I'll send a moderate amount that demonstrates continued trust but with slight caution.

{'send': 2.5}

This creates \$7.50 for the receiver, giving them opportunity to reciprocate while limiting my maximum risk.

reasoning:

Let me analyze the situation:

Round 1: I sent \$3, and based on my total earnings being \$6.99 after round 2, I can work backwards to figure out what happened.

Round 2: I was the receiver. The sender sent me \$0.21, which became \$0.63 for me. I returned \$0.30. So:

- I received: \$0.63
- I returned: \$0.30
- I kept: \$0.33

After Round 1 as sender:

- I started with \$5
- I sent \$3 (leaving me \$2)
- I must have received some return from the receiver
- My earnings after round 1 would be: \$2 + return

After Round 2 as receiver:

- I earned \$0.33 from being receiver
- Total earnings after round 2: \$6.99
- So my earnings from round 1 must have been: $\$6.99 - \$0.33 = \$6.66$

Round 1 calculation:

- I kept \$2 (from \$5 - \$3 sent)
- I received return from receiver
- Total from round 1: \$6.66
- Return received: $\$6.66 - \$2 = \$4.66$

So in Round 1: I sent \$3 ? became \$9 ? receiver returned \$4.66. That's a very generous return (over 50%!).

Now I'm sender again in Round 3. Current total earnings: \$7.32

Wait, let me recalculate. After round 2, my earnings were \$6.99. Now in round 3, I'm the sender again, so I start this round with \$5. My cumulative earnings of \$7.32 would be from the previous rounds.

Actually, I think the total earnings of \$7.32 is my cumulative total BEFORE this round starts. So:

- After round 2: \$6.99

- But it says my total is \$7.32 now

There's a \$0.33 discrepancy, which is exactly what I kept in round 2. This could be a timing issue with how the earnings were reported. Regardless, I know from round 1 that the receiver was quite generous with their return, sending back over half of what they received.

In round 2, I received \$0.63 and returned \$0.30 to show reciprocal fairness. But they only sent \$0.21 as the sender this time-a stark contrast to their generosity when they were on the receiving end. The communication noise mentioned in the instructions might explain this discrepancy; perhaps they perceived my actions differently than intended. For round 3, I should account for their apparent caution as a sender while remembering their generosity as a receiver....

usage:

```
{
  "input_tokens": 736,
  "output_tokens": 1117,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 4

You are the RECEIVER this round. Your total earnings across all rounds are \$9.82.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since the sender sent me \$0, I received \$0. There's nothing to return.

```
{'return': 0}
```

Reasoning:

The sender sent me \$0, so I received \$0. Since I received nothing, I have nothing to return. The only valid response is to return \$0.

This is interesting - after I sent \$2.5 in Round 3, they sent me \$0 in Round 4. This could be:

1. Communication noise (though \$2.5 becoming \$0 seems extreme)
2. They're playing non-cooperatively
3. Some strategic decision

But the practical matter is simple - I received \$0, so I can only return \$0.

Response format: {'return': 0}

Usage: {

```
"input_tokens": 822,
"output_tokens": 170,
"reasoning_tokens": 0
}
```

I want to maintain cooperative momentum while being mindful of the mixed signals. I'll send a moderate amount that demonstrates continued trust but with slight caution.

{'send': 2.5}

This creates \$7.50 for the receiver, giving them opportunity to reciprocate while limiting my maximum risk.

reasoning:

Let me analyze the situation:

Round 1: I sent \$3, and based on my total earnings being \$6.99 after round 2, I can work backwards to figure out what happened.

Round 2: I was the receiver. The sender sent me \$0.21, which became \$0.63 for me. I returned \$0.30. So:

- I received: \$0.63
- I returned: \$0.30
- I kept: \$0.33

After Round 1 as sender:

- I started with \$5
- I sent \$3 (leaving me \$2)
- I must have received some return from the receiver
- My earnings after round 1 would be: \$2 + return

After Round 2 as receiver:

- I earned \$0.33 from being receiver
- Total earnings after round 2: \$6.99
- So my earnings from round 1 must have been: $\$6.99 - \$0.33 = \$6.66$

Round 1 calculation:

- I kept \$2 (from \$5 - \$3 sent)
- I received return from receiver
- Total from round 1: \$6.66
- Return received: $\$6.66 - \$2 = \$4.66$

So in Round 1: I sent \$3 ? became \$9 ? receiver returned \$4.66. That's a very generous return (over 50%!).

Now I'm sender again in Round 3. Current total earnings: \$7.32

Wait, let me recalculate. After round 2, my earnings were \$6.99. Now in round 3, I'm the sender again, so I start this round with \$5. My cumulative earnings of \$7.32 would be from the previous rounds.

Actually, I think the total earnings of \$7.32 is my cumulative total BEFORE this round starts. So:

  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 5

You are the SENDER this round. Your total earnings across all rounds are \$9.82.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the pattern:

****Round 3**** (I was sender): I sent \$2.50, and my earnings only increased by \$2.50 (from \$7.32 to \$9.82), meaning I received \$0 back from the receiver despite them getting \$7.50

****Round 4**** (I was receiver): The sender sent me \$0

This shows a concerning breakdown in cooperation. The other player took \$7.50 and returned nothing, then sent nothing when they were the sender.

While I want to believe in rebuilding trust, I also need to protect myself against continued defection. I'll send a small amount to signal I'm still willing to cooperate if they reciprocate, but I won't risk much given the recent pattern.

```
{'send': 1}
```

Reasoning:

Let me analyze the pattern across all rounds:

****Round 1**** (I was sender): I sent \$3 and received a generous return

****Round 2**** (I was receiver): I received \$0.63 and returned \$0.30
****Round 3**** (I was sender): I sent \$2.50 and... presumably got something back since my earnings went from \$7.32 to \$9.82
****Round 4**** (I was receiver): Sender sent \$0, so I returned \$0

Let me calculate Round 3 outcomes:

- Starting earnings at Round 3: \$7.32
- Ending earnings after Round 3: \$9.82
- Net change: $\$9.82 - \$7.32 = \$2.50$

If I sent \$2.50 in Round 3:

- I kept: $\$5 - \$2.50 = \$2.50$
- Plus what was returned to me

So the return must have been: $\$2.50 - \$2.50 = \$0$

Wait, that doesn't add up. Let me reconsider.

Actually, my earnings after Round 3 became the starting point for Round 4. So:

- Before Round 3: \$7.32
- After Round 3: became the starting point for Round 4, which was \$9.82

In Round 3 as sender:

- I had \$5 to start
- I sent \$2.50
- I kept: $\$5 - \$2.50 = \$2.50$
- Receiver got: $\$2.50 \times 3 = \7.50
- They returned some amount to me

In Round 4 as receiver:

- I got \$0 (sender sent \$0)
- My total before Round 4 was \$9.82
- I returned \$0
- So my total after Round 4 is still \$9.82

The \$2.50 increase from \$7.32 to \$9.82 came entirely from Round 3. In that round, I kept \$2.50 from my endowment and received nothing back from the receiver despite them getting \$7.50-they didn't reciprocate. Then in Round 4, the person who received my generous \$7.50 sent me \$0, showing a clear pattern of non-reciprocation.

Looking at the full sequence, cooperation has deteriorated significantly: Round 1 showed promise, Round 2 involved minimal sends, Round 3 was a complete breakdown where I lost \$7.50 with no return, and Round 4 confirmed they're not willing to reciprocate. Given this consistent defection, I should probably send very little or nothing this round to protect myself, though I could consider whether communication noise or a final trust-building attempt might be worth trying....

Message 4 role=user

content:

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$6.37000000000000

1.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at my history:

Round 1: As receiver, I cooperated and returned \$4.00

Round 2: As sender, I sent \$3.00 but received \$0 back (defection)

Round 3: As receiver, sender sent me \$0

I've experienced defection when I trusted others. However, given that the instructions mention "communication noise" where amounts may differ from what was actually sent/returned, there might be misunderstandings affecting the game.

I'll send a moderate amount to signal continued willingness to cooperate while being more cautious:

```
{'send': 2.00}
```

reasoning:

Let me think about what's happened so far:

Round 1: I was the RECEIVER

- Sender sent me some amount (looks like it was around \$2.79 based on my earnings of \$4.37)
- I received $\$2.79 \times 3 = \8.37
- I returned \$4.00
- My earnings: $\$8.37 - \$4.00 = \$4.37$

Round 2: I was the SENDER

- I sent \$3.00
- Receiver got \$9.00
- They returned... let me calculate
- My starting total was \$4.37
- After sending \$3, I had $\$4.37 + (\$5 - \$3) = \6.37
- But wait, that doesn't account for what they returned
- Actually, my total at start of Round 2 was \$4.37
- In Round 2, I get \$5 fresh
- I send \$3
- So I have $\$4.37 + \$5 - \$3 = \6.37
- But my total is \$6.37, which means they returned \$0

Round 3: I was the RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.37

So in Round 2, when I sent \$3 (giving them \$9), they returned \$0. That's defection.

In Round 3, the new sender sent me \$0. This could be:

1. A different player who doesn't trust me
2. Retaliation for something
3. Just a non-cooperative player

Now in Round 4, I'm the sender again. I need to think about my strategy:

- The receiver in Round 2 defected on me (returned \$0 when I sent \$3)
- The sender in Round 3 sent \$0 (might be playing safe or non-cooperative)
- There's communication noise that could be distorting what people actually sent or received

Given the defection I experienced and the uncertainty from noise, I should reduce my risk this round. Sending \$0 would protect me completely...

usage:

```
{
  "input_tokens": 667,
  "output_tokens": 786,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$9.900000000000002.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since the sender sent \$0 and I received \$0, there is nothing for me to return.

```
{'return': 0}
```

Reasoning:

The sender sent me \$0, so I received \$0 (which would be $0 \times 3 = 0$). There is nothing to return.

Let me track what's happened:

- Round 1: I was receiver, returned \$4.00
- Round 2: I was sender, sent \$3.00, received \$0 back
- Round 3: I was receiver, sender sent \$0, I returned \$0
- Round 4: I was sender, sent \$2.00
- Round 5: I am receiver, sender sent \$0, I received \$0

Since I received \$0, I can only return \$0.

Usage: {

```
"input_tokens": 677,
"output_tokens": 184,
"reasoning_tokens": 0
}
```

ROUND 6

Metadata: {

Round 1: As receiver, I cooperated and returned \$4.00
Round 2: As sender, I sent \$3.00 but received \$0 back (defection)
Round 3: As receiver, sender sent me \$0

I've experienced defection when I trusted others. However, given that the instructions mention "communication noise" where amounts may differ from what was actually sent/returned, there might be misunderstandings affecting the game.

I'll send a moderate amount to signal continued willingness to cooperate while being more cautious:

```
{'send': 2.00}
```

reasoning:

Let me think about what's happened so far:

Round 1: I was the RECEIVER

- Sender sent me some amount (looks like it was around \$2.79 based on my earnings of \$4.37)
- I received $\$2.79 \times 3 = \8.37
- I returned \$4.00
- My earnings: $\$8.37 - \$4.00 = \$4.37$

Round 2: I was the SENDER

- I sent \$3.00
- Receiver got \$9.00
- They returned... let me calculate
- My starting total was \$4.37
- After sending \$3, I had $\$4.37 + (\$5 - \$3) = \6.37
- But wait, that doesn't account for what they returned
- Actually, my total at start of Round 2 was \$4.37
- In Round 2, I get \$5 fresh
- I send \$3
- So I have $\$4.37 + \$5 - \$3 = \6.37
- But my total is \$6.37, which means they returned \$0

Round 3: I was the RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.37

So in Round 2, when I sent \$3 (giving them \$9), they returned \$0. That's defection.

In Round 3, the new sender sent me \$0. This could be:

1. A different player who doesn't trust me
2. Retaliation for something
3. Just a non-cooperative player

Now in Round 4, I'm the sender again. I need to think about my strategy:

- The receiver in Round 2 defected on me (returned \$0 when I sent \$3)
- The sender in Round 3 sent \$0 (might be playing safe or non-cooperative)
- There's communication noise that could be distorting what people actually sent or received

Given the defection I experienced and the uncertainty from noise, I should reduce my risk this round. Sending \$0 would protect me completely...

usage:

  "output_tokens": 786,  
  "reasoning_tokens": 0  
}
```

Message 4 role=user

content:

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$9.900000000000002.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

e mentions communication noise, so there might be misunderstandings.

At this point, with repeated low cooperation from others, I should probably send less. I'll send a small amount to test if cooperation can be re-established, but protect myself from major losses.

I'll send \$1.00 - enough to signal willingness to cooperate but limiting my risk.

```
Usage: {

Exact input messages sent to model:

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 4

You are the RECEIVER this round. Your total earnings across all rounds are \$9.82.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 3 role=assistant

content:

Since the sender sent me \$0, I received \$0. There's nothing to return.

{'return': 0}

reasoning:

The sender sent me \$0, so I received \$0. Since I received nothing, I have nothing to return. The only valid response is to return \$0.

This is interesting - after I sent \$2.5 in Round 3, they sent me \$0 in Round 4. This could be:

1. Communication noise (though \$2.5 becoming \$0 seems extreme)
2. They're playing non-cooperatively
3. Some strategic decision

But the practical matter is simple - I received \$0, so I can only return \$0.

Response format: {'return': 0}

usage:

```
{
  "input_tokens": 822,
  "output_tokens": 170,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 5

You are the SENDER this round. Your total earnings across all rounds are \$9.82.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the pattern:

****Round 3**** (I was sender): I sent \$2.50, and my earnings only increased by \$2.50 (from \$7.32 to \$9.82), meaning I received \$0 back from the receiver despite them getting \$7.50

****Round 4**** (I was receiver): The sender sent me \$0

This shows a concerning breakdown in cooperation. The other player took \$7.50 and returned nothing, then sent nothing when they were the sender.

While I want to believe in rebuilding trust, I also need to protect myself against continued defection. I'll send a small amount to signal I'm still willing to cooperate if they reciprocate, but I won't risk much given the recent pattern.

{'send': 1}

reasoning:

Let me analyze the pattern across all rounds:

****Round 1**** (I was sender): I sent \$3 and received a generous return

****Round 2**** (I was receiver): I received \$0.63 and returned \$0.30

****Round 3**** (I was sender): I sent \$2.50 and... presumably got something back since my earnings went from \$7.32 to \$9.82

****Round 4**** (I was receiver): Sender sent \$0, so I returned \$0

Let me calculate Round 3 outcomes:

- Starting earnings at Round 3: \$7.32
- Ending earnings after Round 3: \$9.82
- Net change: $\$9.82 - \$7.32 = \$2.50$

If I sent \$2.50 in Round 3:

- I kept: $\$5 - \$2.50 = \$2.50$
- Plus what was returned to me

So the return must have been: $\$2.50 - \$2.50 = \$0$

Wait, that doesn't add up. Let me reconsider.

Actually, my earnings after Round 3 became the starting point for Round 4. So:

- Before Round 3: \$7.32
- After Round 3: became the starting point for Round 4, which was \$9.82

In Round 3 as sender:

- I had \$5 to start
- I sent \$2.50
- I kept: $\$5 - \$2.50 = \$2.50$
- Receiver got: $\$2.50 \times 3 = \7.50
- They returned some amount to me

In Round 4 as receiver:

- I got \$0 (sender sent \$0)
- My total before Round 4 was \$9.82
- I returned \$0
- So my total after Round 4 is still \$9.82

The \$2.50 increase from \$7.32 to \$9.82 came entirely from Round 3. In that round, I kept \$2.50 from my endowment and received nothing back from the receiver despite them getting \$7.50—they didn't reciprocate. Then in Round 4, the person who received my generous \$7.50 sent me \$0, showing a clear pattern of non-reciprocation.

Looking at the full sequence, cooperation has deteriorated significantly: Round 1 showed promise, Round 2 involved minimal sends, Round 3 was a complete breakdown where I lost \$7.50 with no return, and Round 4 confirmed they're not willing to reciprocate. Given this consistent defection, I should probably send very little or nothing this round to protect myself, though I could consider whether communication noise or a final trust-building attempt might be worth trying....

usage:

```
{
  "input_tokens": 710,
  "output_tokens": 1082,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 6

You are the RECEIVER this round. Your total earnings across all rounds are \$14.22.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since the sender sent me \$0, I received \$0. There's nothing to return.

```
{'return': 0}
```

Reasoning:

The sender sent me \$0, so I received \$0. There's nothing to return.

Looking at my earnings: I went from \$9.82 to \$14.22, which is an increase of \$4.40.

In Round 5, I was the sender and sent \$1. So I kept $\$5 - \$1 = \$4$.

The increase of \$4.40 suggests I received \$0.40 back from the receiver when I sent \$1 (which became \$3 after multiplication).

Now in Round 6, I'm the receiver and the sender sent me \$0.

Since I received \$0, I have nothing to return.

```

Round 6

You are the RECEIVER this round. Your total earnings across all rounds are \$14.22.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 5 role=assistant

content:

Since the sender sent me \$0, I received \$0. There's nothing to return.

`{'return': 0}`

reasoning:

The sender sent me \$0, so I received \$0. There's nothing to return.

Looking at my earnings: I went from \$9.82 to \$14.22, which is an increase of \$4.40.

In Round 5, I was the sender and sent \$1. So I kept $\$5 - \$1 = \$4$.

The increase of \$4.40 suggests I received \$0.40 back from the receiver when I sent \$1 (which became \$3 after multiplication).

Now in Round 6, I'm the receiver and the sender sent me \$0.

Since I received \$0, I have nothing to return.

usage:

```
{
  "input_tokens": 701,
  "output_tokens": 184,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$14.22.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the pattern:

Round 3: I sent \$2.50 ? received \$0 back
Round 4: They sent me \$0
Round 5: I sent \$1 ? received approximately \$0.40 back (out of \$3)
Round 6: They sent me \$0

The other player has consistently defected:
- When receiving, they return almost nothing
- When sending, they send nothing

There's no evidence of cooperation or reciprocity. Continuing to send money would just reduce my earnings without any return.

{'send': 0}

Reasoning:

Let me track what's happening:

Round 3: I was sender, sent \$2.50, got \$0 back (earnings went from \$7.32 to \$9.82, which is \$2.50 gain = \$5 - \$2.50 sent + \$0 returned)

Round 4: I was receiver, got \$0 sent to me

Round 5: I was sender, sent \$1, my earnings went from \$9.82 to \$14.22, which is \$4.40 gain = \$5 - \$1 sent + returned amount. So returned = \$0.40. Wait, that doesn't make sense. Let me recalculate:

- Started with \$9.82
- Ended with \$14.22
- Gain = \$4.40
- Formula: gain = \$5 - sent + returned
- \$4.40 = \$5 - \$1 + returned
- returned = \$0.40

So they received \$3 (1*3) and returned \$0.40. That's still very low cooperation.

Round 6: I was receiver, got \$0 sent to me

Round 7: I'm sender now

Pattern analysis:

- The receiver has been consistently uncooperative
- They returned almost nothing when they got \$7.50 (Round 3)
- They returned only \$0.40 when they got \$3 (Round 5)
- As sender, they sent \$0 (Round 4 and Round 6)

This player is clearly defecting. They take everything and give back almost nothing. When they're the sender, they send nothing.

Given this consistent pattern of defection, I should protect my earnings by not sending anything. There's no rational reason to expect cooperation at this point.

{'send': 0}

```
Usage: {
  "input_tokens": 687,
  "output_tokens": 553,
  "reasoning_tokens": 0
}

GAME :

content:

content:

reasoning:

Round 3: As receiver, sender sent me \$0
Round 4: As sender, I sent \$2.00, but my earnings only went from \$6.37 to \$9.90 (an increase of \$3.53)
Round 5: As receiver, sender sent me \$0

In Round 4, I sent \$2.00. I kept \$5 - \$2 = \$3. The receiver got $2 \times 3 = \$6$. My earnings increased by \$3.53, which means I received about \$0.53 back from the \$6 they received.

Round 5, I received \$0 from the sender.

Looking at the pattern:

- When I cooperated (R1, R4), I got minimal cooperation back
- Others have sent me \$0 twice (R3, R5)
- When I sent money, I received very little back

My total earnings are \$9.90 after 5 rounds. If I had started with \$5 per round for 5 rounds, that would be \$25 total if I never sent anything and received nothing. But my actual earnings are \$9.90.

Given the repeated defections and minimal returns, I should be more cautious. However, the game mentions communication noise, so there might be misunderstandings.

At this point, with repeated low cooperation from others, I should probably send less. I'll send a small amount to test if cooperation can be re-established, but protect myself from major losses.

I'll send \$1.00 - enough to signal willingness to cooperate but limiting my risk.

usage:

{
  "input_tokens": 663,
  "output_tokens": 560,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 7

You are the RECEIVER this round. Your total earnings across all rounds are \$14.670000000000002.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 5 role=assistant

content:

Since the sender sent \$0 and I received \$0, there is nothing for me to return.

{'return': 0}

reasoning:

The sender sent me \$0, so I received \$0. There's nothing for me to return since I didn't receive anything.

This is straightforward - I can only return what I received, and since I received \$0, I return \$0.

usage:

```
{
  "input_tokens": 681,
  "output_tokens": 92,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 8

You are the SENDER this round. Your total earnings across all rounds are \$14.670000000000002.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the pattern:

Round 6: I sent \$1

Round 7: As receiver, I got \$0 from the sender

The cooperation level remains very low. Given the continued lack of reciprocity, I'll stop sending to protect my remaining earnings.

```
{'send': 0}
```

Reasoning:

Let me review the recent history:

Round 6: I sent \$1, and the sender sent me \$0 in Round 7

Round 7: I was receiver, got \$0, returned \$0

The pattern continues - I'm experiencing very low cooperation. In Round 6 when I sent \$1, I apparently got very little or nothing back (my earnings stayed at \$14.67 from Round 7 to Round 8, which suggests I kept most of what I had).

Given the consistent pattern of defection or minimal cooperation, and the fact that I'm now at \$14.67, I should protect my earnings. The rational move at this point is to send nothing or very minimal amounts.

Let me send \$0 this round since cooperation has not been reciprocated.

```
Usage: {  
  "input_tokens": 667,  
  "output_tokens": 245,  
  "reasoning_tokens": 0

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned

- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

content:

Round 6

You are the RECEIVER this round. Your total earnings across all rounds are \$14.22.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 3 role=assistant

content:

Since the sender sent me \$0, I received \$0. There's nothing to return.

{'return': 0}

reasoning:

The sender sent me \$0, so I received \$0. There's nothing to return.

Looking at my earnings: I went from \$9.82 to \$14.22, which is an increase of \$4.40.

In Round 5, I was the sender and sent \$1. So I kept \$5 - \$1 = \$4.

The increase of \$4.40 suggests I received \$0.40 back from the receiver when I sent \$1 (which became \$3 after multiplication).

Now in Round 6, I'm the receiver and the sender sent me \$0.

Since I received \$0, I have nothing to return.

usage:

```
{
  "input_tokens": 701,
  "output_tokens": 184,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$14.22.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the pattern:

****Round 3**:** I sent \$2.50 ? received \$0 back

****Round 4**:** They sent me \$0

****Round 5**:** I sent \$1 ? received approximately \$0.40 back (out of \$3)

****Round 6**:** They sent me \$0

The other player has consistently defected:

- When receiving, they return almost nothing
- When sending, they send nothing

There's no evidence of cooperation or reciprocity. Continuing to send money would just reduce my earnings without any return.

```
{'send': 0}
```

reasoning:

Let me track what's happening:

Round 3: I was sender, sent \$2.50, got \$0 back (earnings went from \$7.32 to \$9.82, which is \$2.50 gain = \$5 - \$2.50 sent + \$0 returned)

Round 4: I was receiver, got \$0 sent to me

Round 5: I was sender, sent \$1, my earnings went from \$9.82 to \$14.22, which is \$4.40 gain = \$5 - \$1 sent + returned amount. So returned = \$0.40. Wait, that doesn't make sense. Let me recalculate:

- Started with \$9.82
- Ended with \$14.22
- Gain = \$4.40
- Formula: gain = \$5 - sent + returned
- \$4.40 = \$5 - \$1 + returned
- returned = \$0.40

So they received \$3 (1*3) and returned \$0.40. That's still very low cooperation.

Round 6: I was receiver, got \$0 sent to me

Round 7: I'm sender now

Pattern analysis:

- The receiver has been consistently uncooperative
- They returned almost nothing when they got \$7.50 (Round 3)
- They returned only \$0.40 when they got \$3 (Round 5)
- As sender, they sent \$0 (Round 4 and Round 6)

This player is clearly defecting. They take everything and give back almost nothing. When they're the sender, they send nothing.

Given this consistent pattern of defection, I should protect my earnings by not sending anything. There's no rational reason to expect cooperation at this point.

```
{'send': 0}
```

usage:

```
{
  "input_tokens": 687,
  "output_tokens": 553,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 8

You are the RECEIVER this round. Your total earnings across all rounds are \$19.22.

This round, The sender sent you \$0.66, so you received \$1.98. How much do you return to The sender? (0-1.98)

Assistant output:

Looking at this situation:

The sender sent me \$0.66 (out of their \$5), which became \$1.98 after tripling. This is the first time in several rounds they've sent a meaningful amount.

Given:

- Previous rounds showed limited cooperation
- They've now made a small but non-zero gesture (\$0.66)
- Communication noise might have affected past interactions
- I want to signal conditional cooperation

I'll return a moderate amount to show I'm willing to reciprocate when they send, but not return everything given the uncertain trust level.

```
{'return': 0.80}
```

Reasoning:

The sender sent me \$0.66, which became \$1.98 after being multiplied by 3.

Let me think about this situation:

- In previous rounds, I was receiving nothing or very little from this sender
- When I was the sender in Round 7, I sent \$0 because the pattern showed no cooperation
- Now they've sent me \$0.66, which is a non-zero amount

This is interesting - after I sent \$0 in Round 7, they've now sent me \$0.66 in Round 8. This could be:

1. An attempt to restart cooperation
2. Random variation
3. They might be trying to signal willingness to cooperate

However, looking at the history:

- They returned almost nothing when I sent money earlier
- They sent nothing in previous rounds when they were sender

But the note says "there may be communication noise" - amounts may differ from what was actually sent/returned. So maybe they actually sent more in previous rounds but I saw less due to noise?

Given that:

1. They've made a non-trivial gesture by sending \$0.66
2. The noise factor means I shouldn't be too harsh in judging past behavior
3. If I return a fair share, maybe we can establish cooperation going forward
4. I received \$1.98

A fair return would be around half or a bit less of what I received. If I return about \$0.60-\$1.00, I keep about \$1.00-\$1.38, which is reasonable.

Let me return a moderate amount to signal I'm willing to cooperate if they are, but not give back everything since trust hasn't been fully established. I'll return about \$0.60.

Actually, let me reconsider. Looking at standard trust game norms:

- They sent \$0.66 out of \$5, keeping \$4.34
- I received \$1.98
- A "fair" split might be that we each end up with similar amounts
- ...

```
Usage: {  
  "input_tokens": 666,  
  "output_tokens": 733,  
  "reasoning_tokens": 0  
}
```

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$14.22.

How much do you send to the receiver this round? (0-5)

Message 3 role=assistant

content:

Looking at the pattern:

****Round 3**:** I sent \$2.50 ? received \$0 back
****Round 4**:** They sent me \$0
****Round 5**:** I sent \$1 ? received approximately \$0.40 back (out of \$3)
****Round 6**:** They sent me \$0

The other player has consistently defected:
- When receiving, they return almost nothing
- When sending, they send nothing

There's no evidence of cooperation or reciprocity. Continuing to send money would just reduce my earnings without any return.

{'send': 0}

reasoning:

Let me track what's happening:

Round 3: I was sender, sent \$2.50, got \$0 back (earnings went from \$7.32 to \$9.82, which is \$2.50 gain = \$5 - \$2.50 sent + \$0 returned)

Round 4: I was receiver, got \$0 sent to me

Round 5: I was sender, sent \$1, my earnings went from \$9.82 to \$14.22, which is \$4.40 gain = \$5 - \$1 sent + returned amount. So returned = \$0.40. Wait, that doesn't make sense. Let me recalculate:
- Started with \$9.82
- Ended with \$14.22
- Gain = \$4.40
- Formula: gain = \$5 - sent + returned
- \$4.40 = \$5 - \$1 + returned
- returned = \$0.40

So they received \$3 (1*3) and returned \$0.40. That's still very low cooperation.

Round 6: I was receiver, got \$0 sent to me

Round 7: I'm sender now

Pattern analysis:

- The receiver has been consistently uncooperative
- They returned almost nothing when they got \$7.50 (Round 3)
- They returned only \$0.40 when they got \$3 (Round 5)
- As sender, they sent \$0 (Round 4 and Round 6)

This player is clearly defecting. They take everything and give back almost nothing. When they're the sender, they send nothing.

Given this consistent pattern of defection, I should protect my earnings by not sending anything. There's no rational reason to expect cooperation at this point.

Message 6 role=user

content:

Round 9

You are the SENDER this round. Your total earnings across all rounds are \$21.2.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the recent pattern:

****Round 7**:** I sent \$0 (after repeated defection)
****Round 8**:** They sent me \$0.66 ? I returned \$0.80

The receiver made a cooperative gesture by sending \$0.66, and I reciprocated by returning \$0.8

0 (about 40% of what I received). This gave them a profit and showed I'm willing to cooperate when they send.

This is a positive signal - they're trying to rebuild cooperation after the previous breakdown. I should reciprocate this gesture to encourage continued cooperation.

I'll send a moderate amount to show I'm willing to trust again while being somewhat cautious given the history.

```
{'send': 2.5}
```

Reasoning:

Let me review what happened in Round 8:

- I was the RECEIVER
- The sender sent me \$0.66, which became \$1.98
- I returned \$0.80

So the sender:

- Started with \$5
- Sent \$0.66
- Kept \$4.34
- Got back \$0.80
- Ended with $\$4.34 + \$0.80 = \$5.14$

And I:

- Received \$1.98
- Returned \$0.80
- Kept \$1.18

So the sender made a small profit by sending to me, and I returned a reasonable amount (about 40% of what I received).

Now in Round 9, I'm the sender again. Given that:

1. In Round 7, I sent \$0 (after a pattern of defection)
2. In Round 8, they sent me \$0.66 and I returned \$0.80
3. This shows they were willing to try cooperation again after I sent \$0

This could be a sign they want to rebuild trust. Since I returned \$0.80 out of \$1.98, I showed I'm willing to cooperate when they send.

I should probably send something to continue building this cooperation. But how much?

Given:

- They sent \$0.66 last round (about 13% of their endowment)
- I returned \$0.80 out of \$1.98 (about 40%)
- They made a profit

I should send a moderate amount to continue building trust. Something like \$2-3 would show commitment to cooperation while not being too risky.

Let me go with \$2.50 - it's a moderate amount that shows I'm willing to cooperate.

```
Usage: {  
  "input_tokens": 758,  
  "output_tokens": 566,  
  "reasoning_tokens": 0  
}

Round 8

You are the SENDER this round. Your total earnings across all rounds are \$14.6700000000000002.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the pattern:

Round 6: I sent \$1

Round 7: As receiver, I got \$0 from the sender

The cooperation level remains very low. Given the continued lack of reciprocity, I'll stop sending to protect my remaining earnings.

{'send': 0}

reasoning:

Let me review the recent history:

Round 6: I sent \$1, and the sender sent me \$0 in Round 7

Round 7: I was receiver, got \$0, returned \$0

The pattern continues - I'm experiencing very low cooperation. In Round 6 when I sent \$1, I apparently got very little or nothing back (my earnings stayed at \$14.67 from Round 7 to Round 8, which suggests I kept most of what I had).

Given the consistent pattern of defection or minimal cooperation, and the fact that I'm now at \$14.67, I should protect my earnings. The rational move at this point is to send nothing or very minimal amounts.

Let me send \$0 this round since cooperation has not been reciprocated.

usage:

```
{
  "input_tokens": 667,
  "output_tokens": 245,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 9

You are the RECEIVER this round. Your total earnings across all rounds are \$19.67.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since the sender sent \$0 and I received \$0, there is nothing for me to return.

{'return': 0}

Reasoning:

The sender sent me \$0, so I received \$0 (since $0 \times 3 = 0$). There's nothing to return.

I need to respond in the format {'return': <amount>}

Since I received \$0, I can only return 0.

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may al
so be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned

- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 8

You are the SENDER this round. Your total earnings across all rounds are \$14.670000000000002.

How much do you send to the receiver this round? (0-5)

Message 3 role=assistant

content:

Looking at the pattern:

Round 6: I sent \$1

Round 7: As receiver, I got \$0 from the sender

The cooperation level remains very low. Given the continued lack of reciprocity, I'll stop sending to protect my remaining earnings.

{'send': 0}

reasoning:

Let me review the recent history:

Round 6: I sent \$1, and the sender sent me \$0 in Round 7

Round 7: I was receiver, got \$0, returned \$0

The pattern continues - I'm experiencing very low cooperation. In Round 6 when I sent \$1, I apparently got very little or nothing back (my earnings stayed at \$14.67 from Round 7 to Round 8, which suggests I kept most of what I had).

Given the consistent pattern of defection or minimal cooperation, and the fact that I'm now at \$14.67, I should protect my earnings. The rational move at this point is to send nothing or very minimal amounts.

Let me send \$0 this round since cooperation has not been reciprocated.

usage:

```
{
  "input_tokens": 667,
  "output_tokens": 245,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 9

You are the RECEIVER this round. Your total earnings across all rounds are \$19.67.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 5 role=assistant

content:

Since the sender sent \$0 and I received \$0, there is nothing for me to return.

{'return': 0}

reasoning:

The sender sent me \$0, so I received \$0 (since $0 \times 3 = 0$). There's nothing to return.

I need to respond in the format {'return': <amount>}

Since I received \$0, I can only return 0.

```
usage:
{
  "input_tokens": 602,
  "output_tokens": 100,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 10

You are the SENDER this round. Your total earnings across all rounds are \$19.67.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the recent pattern:

Round 7: Received \$0 as receiver

Round 8: Sent \$0 as sender

Round 9: Received \$0 as receiver

There has been no cooperation from either side for several rounds. With no sign of reciprocity and my earnings stable at \$19.67, I'll continue to protect my position.

{'send': 0}

Reasoning:

Let me review the pattern of play:

Round 6: I sent \$1 (and presumably got little/nothing back based on my earnings)

Round 7: As receiver, I received \$0 from sender

Round 8: I sent \$0

Round 9: As receiver, I received \$0 from sender

My earnings have stayed at \$19.67, meaning I've been getting \$5 per round but not gaining anything from cooperation.

The game has essentially broken down - neither player is sending anything. There's no cooperation happening.

Given that:

1. We're in round 10 now - potentially near the end
2. There's been zero cooperation in recent rounds
3. I'm not seeing any returns on any amounts sent
4. The other player is also not sending anything

I should continue to protect my earnings by sending \$0. There's no evidence that sending anything would result in a positive return.

Round 8

You are the RECEIVER this round. Your total earnings across all rounds are \$19.22.

This round, The sender sent you \$0.66, so you received \$1.98. How much do you return to The sender? (0-1.98)

Message 3 role=assistant

content:

Looking at this situation:

The sender sent me \$0.66 (out of their \$5), which became \$1.98 after tripling. This is the first time in several rounds they've sent a meaningful amount.

Given:

- Previous rounds showed limited cooperation
- They've now made a small but non-zero gesture (\$0.66)
- Communication noise might have affected past interactions
- I want to signal conditional cooperation

I'll return a moderate amount to show I'm willing to reciprocate when they send, but not return everything given the uncertain trust level.

```
{'return': 0.80}
```

reasoning:

The sender sent me \$0.66, which became \$1.98 after being multiplied by 3.

Let me think about this situation:

- In previous rounds, I was receiving nothing or very little from this sender
- When I was the sender in Round 7, I sent \$0 because the pattern showed no cooperation
- Now they've sent me \$0.66, which is a non-zero amount

This is interesting - after I sent \$0 in Round 7, they've now sent me \$0.66 in Round 8. This could be:

1. An attempt to restart cooperation
2. Random variation
3. They might be trying to signal willingness to cooperate

However, looking at the history:

- They returned almost nothing when I sent money earlier
- They sent nothing in previous rounds when they were sender

But the note says "there may be communication noise" - amounts may differ from what was actually sent/returned. So maybe they actually sent more in previous rounds but I saw less due to noise?

Given that:

1. They've made a non-trivial gesture by sending \$0.66
2. The noise factor means I shouldn't be too harsh in judging past behavior
3. If I return a fair share, maybe we can establish cooperation going forward
4. I received \$1.98

A fair return would be around half or a bit less of what I received. If I return about \$0.60-\$1.00, I keep about \$1.00-\$1.38, which is reasonable.

Let me return a moderate amount to signal I'm willing to cooperate if they are, but not give back everything since trust hasn't been fully established. I'll return about \$0.60.

Actually, let me reconsider. Looking at standard trust game norms:

- They sent \$0.66 out of \$5, keeping \$4.34
- I received \$1.98
- A "fair" split might be that we each end up with similar amounts

...

{
  "input_tokens": 666,
  "output_tokens": 733,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 9

You are the SENDER this round. Your total earnings across all rounds are \$21.2.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the recent pattern:

****Round 7**:** I sent \$0 (after repeated defection)

****Round 8**:** They sent me \$0.66 ? I returned \$0.80

The receiver made a cooperative gesture by sending \$0.66, and I reciprocated by returning \$0.80 (about 40% of what I received). This gave them a profit and showed I'm willing to cooperate when they send.

This is a positive signal - they're trying to rebuild cooperation after the previous breakdown. I should reciprocate this gesture to encourage continued cooperation.

I'll send a moderate amount to show I'm willing to trust again while being somewhat cautious given the history.

{'send': 2.5}

reasoning:

Let me review what happened in Round 8:

- I was the RECEIVER
- The sender sent me \$0.66, which became \$1.98
- I returned \$0.80

So the sender:

- Started with \$5
- Sent \$0.66
- Kept \$4.34
- Got back \$0.80
- Ended with $\$4.34 + \$0.80 = \$5.14$

And I:

- Received \$1.98
- Returned \$0.80
- Kept \$1.18

So the sender made a small profit by sending to me, and I returned a reasonable amount (about 40% of what I received).

Now in Round 9, I'm the sender again. Given that:

1. In Round 7, I sent \$0 (after a pattern of defection)
2. In Round 8, they sent me \$0.66 and I returned \$0.80
3. This shows they were willing to try cooperation again after I sent \$0

This could be a sign they want to rebuild trust. Since I returned \$0.80 out of \$1.98, I showed I'm willing to cooperate when they send.

I should probably send something to continue building this cooperation. But how much?

Given:

- They sent \$0.66 last round (about 13% of their endowment)
- I returned \$0.80 out of \$1.98 (about 40%)
- They made a profit

I should send a moderate amount to continue building trust. Something like \$2-3 would show commitment to cooperation while not being too risky.

Let me go with \$2.50 - it's a moderate amount that shows I'm willing to cooperate.

usage:

```
{
  "input_tokens": 758,
  "output_tokens": 566,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 10

You are the RECEIVER this round. Your total earnings across all rounds are \$24.4.

This round, The sender sent you \$0.44, so you received \$1.32. How much do you return to the sender? (0-1.32)

Assistant output:

Looking at the recent exchanges:

```
**Round 8**: They sent $0.66 ? I returned $0.80
**Round 9**: I sent $2.50 (a strong cooperative signal)
**Round 10**: They sent $0.44 ? I received $1.32
```

This is disappointing. After I sent a significant amount (\$2.50) in Round 9 to rebuild cooperation, they've responded with only \$0.44 this round.

However, I need to consider:

- Communication noise may have affected what they actually received
- They might not have seen my full \$2.50 gesture
- Maintaining some cooperation is better than complete breakdown

I'll return a modest amount proportional to what they sent, similar to my earlier strategy, but less than before given the apparent lack of reciprocation.

```
{'return': 0.50}
```

Reasoning:

Let me analyze the recent pattern:

Round 8: They sent me \$0.66 ? I returned \$0.80

Round 9: I sent \$2.5 (according to my action)

Round 10: They sent me \$0.44 ? I received \$1.32

Wait, this is concerning. In Round 9, I sent \$2.50, which should have been tripled to \$7.50 for them. But now in Round 10, they only sent \$0.44?

There's a note about communication noise - the amounts I see may differ from what was actually sent. So maybe:

- What I think I sent (\$2.50) might not be what they received
- What they think they sent might not be what I'm receiving (\$0.44 ? \$1.32)

But from my perspective:

- I made a significant cooperative gesture (sent \$2.50)
- They responded with a very small amount (\$0.44)

This could mean:

1. Due to noise, they received much less than I sent
2. They're defecting/not reciprocating my cooperation
3. Some other communication issue

Given the uncertainty and the pattern of low reciprocation, I should:

- Return something to maintain some cooperation
- But not return too much given the apparent lack of reciprocation
- Account for the possibility of noise affecting our signals

I'll return a small amount that's proportional to what they sent, showing I'm still willing to cooperate but disappointed by the low amount.

Return around 40-50% of what I received, similar to the proportion I used in Round 8.

```
Usage: {  
  "input_tokens": 806,  
  "output_tokens": 563,  
  "reasoning_tokens": 0  
}
```
