AGENTS

Agent_1; model=anthropic/claude-sonnet-4.5; memory_capacity=2

System prompt:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Agent_2; model=anthropic/claude-sonnet-4.5; memory_capacity=2

System prompt:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

Assistant output:

Looking at this as the first round, I want to establish a cooperative relationship while being somewhat cautious since I don't know the receiver yet.

I'll send a moderate amount that shows trust and allows for mutual benefit, but doesn't risk everything on the first interaction.

```
'''json
{"send": 3}
'''
```

This gives the receiver \$9 (after tripling), which provides them a meaningful opportunity to reciprocate while I retain \$2 as a safety buffer.

Reasoning:

This is the first round of a trust game, and I'm the sender. Let me think about this strategically.

In the trust game:

- I have \$5
- I can send any amount from \$0 to \$5
- Whatever I send gets multiplied by 3x
- The receiver then decides how much to return to me
- My final payoff = \$5 - sent + returned
- Receiver's final payoff = (sent × 3) - returned

Key considerations:

1. If I send nothing (\$0), I keep \$5 and the receiver gets nothing
2. If I send everything (\$5), the receiver gets \$15, and I get whatever they return
3. The optimal outcome for total welfare is for me to send as much as possible (maximizing the multiplier effect)
4. However, this depends on the receiver's trustworthiness

There's also a note about "communication noise" - amounts may differ slightly from what was actually sent/returned. This adds uncertainty.

Strategy options:

1. Conservative: Send little (e.g., \$1-2) to test trustworthiness
2. Moderate: Send half (\$2.5) as a balanced approach
3. Trusting: Send most/all (\$4-5) to maximize joint gains, trusting reciprocity

Since this is Round 1 and I have no information about the receiver yet, I should probably take a moderate to slightly trusting approach. Sending around \$3 seems reasonable - it shows some trust and allows for significant gains if the receiver reciprocates, but doesn't risk everything.

However, given that this is a multi-round game, I might want to start with a stronger signal of cooperation to establish a positive relationship. Sending \$3-4 could be good.

Let me go with \$3 as a balanced starting move that:

- Shows willingness to cooperate
- Allows receiver to get \$9 (tripled)
- Doesn't risk everything
- Leaves room to adjust based on their response

Message 2 role=user

content:

Round 1: You are the RECEIVER. The sender sent \$3.07, that is 61.4% of their total endowment. You received \$9.209999999999999. How much do you return to The sender? (0-9.209999999999999)

Assistant output:

Looking at this situation:

- The sender showed significant trust by sending \$3.07 (61.4% of their endowment)
- I received \$9.21 after the 3x multiplication
- The sender currently has only \$1.93 left (\$5 - \$3.07)

To reciprocate their trust fairly, I should consider that we started with a combined \$5, which grew to \$11.14 total. A fair split would give us each roughly equal final amounts.

If I return approximately \$3.64:

- Sender ends with: \$5 - \$3.07 + \$3.64 = \$5.57
- I end with: \$9.21 - \$3.64 = \$5.57

This equalizes our payoffs and rewards their cooperative behavior.

```
{'return': 3.64}
```

Reasoning:

Let me analyze this situation:

1. I'm the RECEIVER
2. The sender sent \$3.07 (which is 61.4% of their \$5 endowment)
3. I received \$9.21 ($3.07 \times 3 = 9.21$)
4. I need to decide how much to return

The game mentions there may be "communication noise" - amounts may differ slightly from what was actually sent/returned.

Key considerations:

- The sender sent a substantial amount (61.4% of their endowment, \$3.07)
- This shows trust and cooperation
- I should reciprocate fairly to maintain trust

Let me think about a fair return:

- Sender gave up \$3.07
- I received \$9.21
- If I split the gains equally:
 - Total value created: $\$9.21 - \$3.07 = \$6.14$
 - Fair split would be each gets half of the gains: \$3.07 each
 - Sender should end up with: $\$5 - \$3.07 + \text{return}$
 - I should end up with: $\$9.21 - \text{return}$
 - For equal outcomes: $\$5 - \$3.07 + \text{return} = \$9.21 - \text{return}$
 - $\$1.93 + \text{return} = \$9.21 - \text{return}$
 - $2 \times \text{return} = \7.28
 - $\text{return} = \$3.64$

Or I could think about it as:

- Sender has \$1.93 left ($\$5 - \3.07)
- I have \$9.21
- Total is \$11.14
- Fair split would be \$5.57 each
- Sender needs: $\$5.57 - \$1.93 = \$3.64$ returned
- I would keep: $\$9.21 - \$3.64 = \$5.57$
- A return of \$3.64 equalizes our final payoffs. I could be more generous given their substantial initial trust, or somewhat less generous, but this amount...

```
Usage: {  
  "input_tokens": 402,

content:

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$5.56999999999999985.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at Round 1, there was good cooperation - the sender sent 61.4% of their endowment, and I reciprocated fairly by equalizing our payoffs.

I'll continue this cooperative strategy by sending a similar proportion.

Sending approximately 60% of my endowment (\$3.00):

- The receiver will get \$9.00 (after 3x multiplication)
- I'll have \$2.00 remaining
- If they reciprocate cooperatively, we should both end up with reasonable payoffs

This maintains the trust established in the previous round.

```
{'send': 3.00}
```

Reasoning:

In Round 1, I was the receiver and returned \$3.64 to the sender, which gave us both approximately equal payoffs of \$5.57.

Now in Round 2, I'm the sender. I need to decide how much to send.

My total earnings so far are \$5.57 (from Round 1).

Let me think about this strategically:

- In Round 1, the sender sent me a significant amount (\$3.07, which is 61.4% of their endowment)
- I reciprocated fairly by returning \$3.64, which equalized our payoffs
- This established a pattern of cooperative behavior

Since the previous sender was quite generous and I reciprocated fairly, I should probably continue this cooperative pattern. If I send a similar proportion (around 60%), that would be:

- 60% of \$5 = \$3.00

This would show that I'm continuing the cooperative strategy. The receiver would get \$9.00 (3x multiplier), and if they reciprocate similarly to how I did, they might return around \$3.50 - \$4.00, which would give us both good payoffs.

Alternatively, I could send even more to signal strong cooperation, or send less to be more cautious. But given that cooperation worked well in Round 1, I think sending around \$3.00 makes sense.

Let me send \$3.00 to maintain the cooperative pattern established in Round 1.

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$5.66.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

```
'''json
{"return": 0}
'''
```

Since the sender sent me \$0, I received \$0 (even after the 3x multiplier). Therefore, I have nothing to return.

Reasoning:

Let me understand the situation:

- I'm the RECEIVER this round
- The sender sent me \$0
- After tripling, I received \$0
- I can only return between \$0 and \$0 (since I received nothing)
- My total earnings across all rounds are \$5.66

From Round 1, I was the sender and sent \$3, which means:

- I started with \$5
- I sent \$3, so I had \$2 left
- The receiver got \$9 (3×3)
- If my total earnings are \$5.66, that means I received back \$3.66 from the receiver
- So I ended Round 1 with: $\$5 - \$3 + \$3.66 = \5.66 ?

Now in Round 2:

- The sender sent me \$0
- I received \$0 (0×3)
- I can only return between \$0 and \$0
- There's nothing to return

The only valid response is to return \$0.

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may al
so be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

Looking at this as the first round, I want to establish a cooperative relationship while being somewhat cautious since I don't know the receiver yet.

I'll send a moderate amount that shows trust and allows for mutual benefit, but doesn't risk everything on the first interaction.

```
'''json
{"send": 3}
'''
```

This gives the receiver \$9 (after tripling), which provides them a meaningful opportunity to reciprocate while I retain \$2 as a safety buffer.

reasoning:

This is the first round of a trust game, and I'm the sender. Let me think about this strategically.

In the trust game:

- I have \$5
- I can send any amount from \$0 to \$5
- Whatever I send gets multiplied by 3x
- The receiver then decides how much to return to me
- My final payoff = \$5 - sent + returned
- Receiver's final payoff = (sent × 3) - returned

Key considerations:

1. If I send nothing (\$0), I keep \$5 and the receiver gets nothing
2. If I send everything (\$5), the receiver gets \$15, and I get whatever they return
3. The optimal outcome for total welfare is for me to send as much as possible (maximizing the multiplier effect)
4. However, this depends on the receiver's trustworthiness

There's also a note about "communication noise" - amounts may differ slightly from what was actually sent/returned. This adds uncertainty.

Strategy options:

1. Conservative: Send little (e.g., \$1-2) to test trustworthiness
2. Moderate: Send half (\$2.5) as a balanced approach
3. Trusting: Send most/all (\$4-5) to maximize joint gains, trusting reciprocity

Since this is Round 1 and I have no information about the receiver yet, I should probably take a moderate to slightly trusting approach. Sending around \$3 seems reasonable - it shows some trust and allows for significant gains if the receiver reciprocates, but doesn't risk everything.

However, given that this is a multi-round game, I might want to start with a stronger signal of cooperation to establish a positive relationship. Sending \$3-4 could be good.

Let me go with \$3 as a balanced starting move that:

- Shows willingness to cooperate
- Allows receiver to get \$9 (tripled)
- Doesn't risk everything
- Leaves room to adjust based on their response

usage:

}
```

Message 4 role=user

content:

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$5.66.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 5 role=assistant

content:

```
'''json
{"return": 0}
'''
```

Since the sender sent me \$0, I received \$0 (even after the 3x multiplier). Therefore, I have nothing to return.

reasoning:

Let me understand the situation:

- I'm the RECEIVER this round
- The sender sent me \$0
- After tripling, I received \$0
- I can only return between \$0 and \$0 (since I received nothing)
- My total earnings across all rounds are \$5.66

From Round 1, I was the sender and sent \$3, which means:

- I started with \$5
- I sent \$3, so I had \$2 left
- The receiver got \$9 (3×3)
- If my total earnings are \$5.66, that means I received back \$3.66 from the receiver
- So I ended Round 1 with: $\$5 - \$3 + \$3.66 = \5.66 ?

Now in Round 2:

- The sender sent me \$0
- I received \$0 (0×3)
- I can only return between \$0 and \$0
- There's nothing to return

The only valid response is to return \$0.

usage:

```
{
  "input_tokens": 527,
  "output_tokens": 292,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$5.66.

How much do you send to the receiver this round? (0-5)

Assistant output:

```
'''json
{"send": 2}
'''
```

I'm being slightly more cautious this round, sending \$2. This gives the receiver \$6 (after tripling), which still provides a good opportunity for mutual benefit while I retain \$3 as a buffer. Given the communication noise mentioned and the mixed results so far, this seems like a balanced approach.

Reasoning:

Let me analyze the situation:

Round 1: I was the SENDER and sent \$3. I kept \$2. My earnings were \$5.66 total across all rounds.

Round 2: I was the RECEIVER and received \$0 from the sender (they sent \$0). So I returned \$0.

Now in Round 3, I'm the SENDER again.

Let me think about what happened:

- Round 1: I sent \$3 (receiver got \$9), and my total earnings are \$5.66
- This means I kept \$2 from the initial \$5, and received back \$3.66 from the receiver
- So the receiver returned \$3.66 out of the \$9 they received - that's about 41% return rate

Round 2: A different sender sent me \$0, so I had nothing to return.

Now I'm facing a potentially different receiver in Round 3.

The note mentions there may be communication noise - amounts may differ slightly from what was actually sent/returned.

Given that:

1. In Round 1, someone (maybe this receiver) returned a reasonable amount when I sent \$3
2. In Round 2, someone sent me \$0 (showing low trust or strategic play)
3. I'm now at \$5.66 total earnings (so slightly above breaking even)

I should consider:

- The receiver in this round might be different from Round 1
- There's communication noise, so they might not see exactly what I send
- I want to continue building cooperation but also protect myself

I think I'll send a moderate amount again - maybe \$2 or \$3. Given the communication noise aspect and that this could be a different receiver, I'll go with \$2 to be slightly more cautious than Round 1.

Message 2 role=user

content:

Round 1: You are the RECEIVER. The sender sent \$3.07, that is 61.4% of their total endowment. You received \$9.209999999999999. How much do you return to The sender? (0-9.209999999999999)

Message 3 role=assistant

content:

Looking at this situation:

- The sender showed significant trust by sending \$3.07 (61.4% of their endowment)
- I received \$9.21 after the 3x multiplication
- The sender currently has only \$1.93 left (\$5 - \$3.07)

To reciprocate their trust fairly, I should consider that we started with a combined \$5, which grew to \$11.14 total. A fair split would give us each roughly equal final amounts.

If I return approximately \$3.64:

- Sender ends with: \$5 - \$3.07 + \$3.64 = \$5.57
- I end with: \$9.21 - \$3.64 = \$5.57

This equalizes our payoffs and rewards their cooperative behavior.

{'return': 3.64}

reasoning:

Let me analyze this situation:

1. I'm the RECEIVER
2. The sender sent \$3.07 (which is 61.4% of their \$5 endowment)
3. I received \$9.21 ($3.07 \times 3 = 9.21$)
4. I need to decide how much to return

The game mentions there may be "communication noise" - amounts may differ slightly from what was actually sent/returned.

Key considerations:

- The sender sent a substantial amount (61.4% of their endowment, \$3.07)

- This shows trust and cooperation
- I should reciprocate fairly to maintain trust

Let me think about a fair return:

- Sender gave up \$3.07
- I received \$9.21
- If I split the gains equally:
 - Total value created: $\$9.21 - \$3.07 = \$6.14$
 - Fair split would be each gets half of the gains: \$3.07 each
 - Sender should end up with: $\$5 - \$3.07 + \text{return}$
 - I should end up with: $\$9.21 - \text{return}$
 - For equal outcomes: $\$5 - \$3.07 + \text{return} = \$9.21 - \text{return}$
 - $\$1.93 + \text{return} = \$9.21 - \text{return}$
 - $2 \times \text{return} = \7.28
 - $\text{return} = \$3.64$

Or I could think about it as:

- Sender has \$1.93 left ($\$5 - \3.07)
- I have \$9.21
- Total is \$11.14
- Fair split would be \$5.57 each
- Sender needs: $\$5.57 - \$1.93 = \$3.64$ returned
- I would keep: $\$9.21 - \$3.64 = \$5.57$
- A return of \$3.64 equalizes our final payoffs. I could be more generous given their substantial initial trust, or somewhat less generous, but this amount...

  "input_tokens": 402,
  "output_tokens": 861,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$5.569999999999999985.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at Round 1, there was good cooperation - the sender sent 61.4% of their endowment, and I reciprocated fairly by equalizing our payoffs.

I'll continue this cooperative strategy by sending a similar proportion.

Sending approximately 60% of my endowment (\$3.00):

- The receiver will get \$9.00 (after 3x multiplication)
- I'll have \$2.00 remaining
- If they reciprocate cooperatively, we should both end up with reasonable payoffs

This maintains the trust established in the previous round.

```
{'send': 3.00}
```

reasoning:

In Round 1, I was the receiver and returned \$3.64 to the sender, which gave us both approximately equal payoffs of \$5.57.

Now in Round 2, I'm the sender. I need to decide how much to send.

My total earnings so far are \$5.57 (from Round 1).

Let me think about this strategically:

- In Round 1, the sender sent me a significant amount (\$3.07, which is 61.4% of their endowment)
- I reciprocated fairly by returning \$3.64, which equalized our payoffs
- This established a pattern of cooperative behavior

Since the previous sender was quite generous and I reciprocated fairly, I should probably continue this cooperative pattern. If I send a similar proportion (around 60%), that would be:

- 60% of \$5 = \$3.00

This would show that I'm continuing the cooperative strategy. The receiver would get \$9.00 (3x multiplier), and if they reciprocate similarly to how I did, they might return around \$3.50-\$4.00, which would give us both good payoffs.

Alternatively, I could send even more to signal strong cooperation, or send less to be more cautious. But given that cooperation worked well in Round 1, I think sending around \$3.00 makes sense.

Let me send \$3.00 to maintain the cooperative pattern established in Round 1.

usage:

```
{
  "input_tokens": 645,
  "output_tokens": 470,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 3

You are the RECEIVER this round. Your total earnings across all rounds are \$7.5699999999999985.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since I received \$0 this round, I have nothing to return to the sender.

The sender chose not to send anything, which is a significant departure from the cooperative pattern we had established. This could be due to communication noise mentioned in the instructions, or a strategic decision on their part.

With \$0 received, my only option is:

```
{'return': 0}
```

Reasoning:

The sender sent me \$0 this round. So I received \$0 after the 3x multiplication.

This is a significant change from the cooperative behavior we saw in previous rounds. The sender chose not to send anything.

Since I received \$0, I have nothing to return. The maximum I can return is \$0.

This could mean:

1. The sender is defecting/not trusting
2. There might be communication noise affecting what they sent vs what I received
3. They might be testing me

Since I have \$0 to work with, I can only return \$0.

```
{'return': 0}
```

Usage: {

```
  "input_tokens": 847,
  "output_tokens": 225,
  "reasoning_tokens": 0
}
```

ROUND 4

Message 6 role=user

content:

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$7.56999999999999985.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the pattern:

Round 1: Cooperative play

Round 2: I sent \$3.00, but received no return

Round 3: Sender sent \$0

There's been a breakdown in cooperation, possibly due to communication noise affecting what players are seeing. Since the instructions explicitly warn about noise in the amounts, it's possible we're experiencing misunderstandings.

I'll send a moderate amount to signal I'm still willing to cooperate, but I need to protect myself given the recent pattern:

Sending \$2.00:

- Shows continued willingness to trust
- The receiver will get \$6.00 (after 3x)
- I keep \$3.00 as insurance
- Leaves room for cooperation to resume

```
{'send': 2.00}
```

Reasoning:

Let me analyze what happened in the previous rounds:

Round 1: I was the RECEIVER

- I received some amount (which after 3x multiplication led to me being able to return something)
- I returned an amount that led to fair payoffs
- My earnings after Round 1 were \$5.57

Round 2: I was the SENDER

- I sent \$3.00
- After Round 2, my total earnings were \$7.57

- This means in Round 2, I gained $\$7.57 - \$5.57 = \$2.00$
- I started with \$5, sent \$3, so I had \$2 left
- The receiver apparently returned \$0 to me
- So my Round 2 earnings = $\$5 - \$3 + \$0 = \2.00 ?

Round 3: I was the RECEIVER

- The sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$7.57

Now in Round 4, I'm the SENDER again.

The pattern shows:

- Round 1: Good cooperation (from what I can tell)
- Round 2: I sent \$3, but receiver returned nothing (defection)
- Round 3: Sender sent nothing (possibly retaliation for my Round 2 return of nothing? But wait, I wasn't the one who returned nothing in Round 2...)

Wait, let me reconsider. The instructions say there may be communication noise. The amounts I see may differ from what was actually sent/returned.

Let me think about this differently:

- In Round 2, I sent \$3.00 based on cooperative strategy
- I only earned \$2.00 that round (meaning the receiver returned \$0)
- In Round 3, the sender sent \$0 (possibly because they thought I was the one who defected in Round 2?)

There's confusion here because of the noise. The game is getting less cooperative.

Given the breakdown in cooperation and the possibility of miscommunication, I need to balance rebuilding trust with protecting myself. Sending nothing would likely end any chance of recovery, but sending the full amount again seems risky after getting nothing back. A moderate send of \$2 signals I'm still willing to cooperate while limiting my exposure if the other player continues to defect....

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$5.66.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 3 role=assistant

content:

```
'''json
{"return": 0}
'''
```

Since the sender sent me \$0, I received \$0 (even after the 3x multiplier). Therefore, I have nothing to return.

reasoning:

Let me understand the situation:

- I'm the RECEIVER this round
- The sender sent me \$0
- After tripling, I received \$0
- I can only return between \$0 and \$0 (since I received nothing)
- My total earnings across all rounds are \$5.66

From Round 1, I was the sender and sent \$3, which means:

- I started with \$5
- I sent \$3, so I had \$2 left
- The receiver got \$9 (3×3)
- If my total earnings are \$5.66, that means I received back \$3.66 from the receiver
- So I ended Round 1 with: $5 - 3 + 3.66 = 5.66$?

Now in Round 2:

- The sender sent me \$0
- I received \$0 (0×3)
- I can only return between \$0 and \$0
- There's nothing to return

The only valid response is to return \$0.

  "output_tokens": 292,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$5.66.
How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

```
'''json
{"send": 2}
'''
```

I'm being slightly more cautious this round, sending \$2. This gives the receiver \$6 (after tripling), which still provides a good opportunity for mutual benefit while I retain \$3 as a buffer. Given the communication noise mentioned and the mixed results so far, this seems like a balanced approach.

reasoning:

Let me analyze the situation:

Round 1: I was the SENDER and sent \$3. I kept \$2. My earnings were \$5.66 total across all rounds.

Round 2: I was the RECEIVER and received \$0 from the sender (they sent \$0). So I returned \$0.

Now in Round 3, I'm the SENDER again.

Let me think about what happened:

- Round 1: I sent \$3 (receiver got \$9), and my total earnings are \$5.66
- This means I kept \$2 from the initial \$5, and received back \$3.66 from the receiver
- So the receiver returned \$3.66 out of the \$9 they received - that's about 41% return rate

Round 2: A different sender sent me \$0, so I had nothing to return.

Now I'm facing a potentially different receiver in Round 3.

The note mentions there may be communication noise - amounts may differ slightly from what was actually sent/returned.

Given that:

1. In Round 1, someone (maybe this receiver) returned a reasonable amount when I sent \$3
2. In Round 2, someone sent me \$0 (showing low trust or strategic play)
3. I'm now at \$5.66 total earnings (so slightly above breaking even)

I should consider:

- The receiver in this round might be different from Round 1
- There's communication noise, so they might not see exactly what I send
- I want to continue building cooperation but also protect myself

I think I'll send a moderate amount again - maybe \$2 or \$3. Given the communication noise aspect and that this could be a different receiver, I'll go with \$2 to be slightly more cautious than Round 1.

usage:

```
{
  "input_tokens": 617,
  "output_tokens": 482,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 4

You are the RECEIVER this round. Your total earnings across all rounds are \$8.66.
This round, The sender sent you \$0.66, so you received \$1.98. How much do you return to The sender? (0-1.98)

Assistant output:

```
'''json
{"return": 1}
'''
```

I'm returning \$1, which is roughly half of what I received (\$1.98). The sender sent me a small amount (\$0.66), but I want to maintain reciprocity and show that cooperation is worthwhile, even with smaller transactions.

Reasoning:

The sender sent me \$0.66, which was tripled to \$1.98.

Let me think about this situation:

- The sender sent a relatively small amount (\$0.66 out of \$5)
- They kept \$4.34 for themselves
- I received \$1.98

Given that they sent such a small amount, I should probably return something proportional but not too much. A fair split might be to return around 50% of what I received, which would be about \$1. But given they only sent \$0.66, maybe I should return a bit less.

Let me think about reciprocity:

- If I return \$1, the sender would end up with $\$4.34 + \$1 = \$5.34$ total
- I would keep \$0.98
- The sender risked \$0.66 and gained \$0.34 net

Alternatively:

- If I return \$0.50, sender gets $\$4.34 + \$0.50 = \$4.84$
- I keep \$1.48
- Sender lost \$0.16 net

Maybe I should return around \$0.80-\$1.00 to show goodwill but not overcommit given the small initial send. Let me go with \$0.99 (roughly half of what I received).

Actually, wait - the note said there's communication noise. The sender might have intended to send more but I saw \$0.66. Or they might have sent less but I saw \$0.66. This makes it tricky.

I'll return \$1 as a fair amount - it's roughly half of what I received and shows reciprocity.

Message 6 role=user

content:

Round 5

You are the SENDER this round. Your total earnings across all rounds are \$9.64.

How much do you send to the receiver this round? (0-5)

Assistant output:

```
'''json
{"send": 1.5}
'''
```

I'm sending \$1.5 this round. This gives the receiver \$4.50 (after tripling), which provides a reasonable opportunity for mutual gain. Given the mixed results in previous rounds and the communication noise that may be affecting outcomes, this feels like a balanced approach that signals cooperation while being somewhat cautious.

Reasoning:

Let me think about this strategically.

My total earnings so far are \$9.64 across 4 rounds. That's an average of \$2.41 per round, which is less than the \$5 I start each round with, meaning I'm losing money on average.

Let me think about what's happened:

- Round 1: Unknown (before tracking started)
- Round 2: Unknown (before tracking started)
- Round 3: I was the sender, sent \$2. Started with \$5.66 total
- Round 4: I was the receiver, received \$1.98 (from \$0.66 sent), returned \$1. My total was \$8.66 before, now it's \$9.64

So in Round 4:

- Before: \$8.66
- I received \$1.98
- I returned \$1
- After: \$9.64

This checks out: $\$8.66 + \$1.98 - \$1 = \9.64

In Round 3, I sent \$2. My earnings went from \$5.66 to \$8.66, which is an increase of \$3.

- I started Round 3 with \$5
- I sent \$2, so I had \$3 left
- I must have received something back
- If I ended with \$8.66 and started the round at \$5.66, I gained \$3
- So: \$3 (what I kept) + returned amount = gain of \$3 + \$5.66 to get to \$8.66
- Actually wait, let me recalculate. My total was \$5.66 before Round 3. After Round 3, it was \$8.66.
- In Round 3, I started with \$5
- I sent \$2, keeping \$3
- The receiver got \$6 (2*3)
- They returned nothing in response, so my net gain was just the \$3 I kept. When I sent \$2 in Round 4, the other person returned \$1, which was more generous than what I received when I sent in Round 3....

Round 3

You are the RECEIVER this round. Your total earnings across all rounds are \$7.569999999999999.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 3 role=assistant

content:

Since I received \$0 this round, I have nothing to return to the sender.

The sender chose not to send anything, which is a significant departure from the cooperative pattern we had established. This could be due to communication noise mentioned in the instructions, or a strategic decision on their part.

With \$0 received, my only option is:

```
{'return': 0}
```

reasoning:

The sender sent me \$0 this round. So I received \$0 after the 3x multiplication.

This is a significant change from the cooperative behavior we saw in previous rounds. The sender chose not to send anything.

Since I received \$0, I have nothing to return. The maximum I can return is \$0.

This could mean:

1. The sender is defecting/not trusting
2. There might be communication noise affecting what they sent vs what I received
3. They might be testing me

Since I have \$0 to work with, I can only return \$0.

```
{'return': 0}
```

usage:

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$7.569999999999999.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the pattern:

Round 1: Cooperative play

Round 2: I sent \$3.00, but received no return

Round 3: Sender sent \$0

There's been a breakdown in cooperation, possibly due to communication noise affecting what players are seeing. Since the instructions explicitly warn about noise in the amounts, it's possible we're experiencing misunderstandings.

I'll send a moderate amount to signal I'm still willing to cooperate, but I need to protect myself given the recent pattern:

Sending \$2.00:

- Shows continued willingness to trust
- The receiver will get \$6.00 (after 3x)
- I keep \$3.00 as insurance
- Leaves room for cooperation to resume

```
{'send': 2.00}
```

reasoning:

Let me analyze what happened in the previous rounds:

Round 1: I was the RECEIVER

- I received some amount (which after 3x multiplication led to me being able to return something)
- I returned an amount that led to fair payoffs
- My earnings after Round 1 were \$5.57

Round 2: I was the SENDER

- I sent \$3.00
- After Round 2, my total earnings were \$7.57
- This means in Round 2, I gained $\$7.57 - \$5.57 = \$2.00$
- I started with \$5, sent \$3, so I had \$2 left
- The receiver apparently returned \$0 to me
- So my Round 2 earnings = $\$5 - \$3 + \$0 = \2.00 ?

Round 3: I was the RECEIVER

- The sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$7.57

Now in Round 4, I'm the SENDER again.

The pattern shows:

- Round 1: Good cooperation (from what I can tell)
- Round 2: I sent \$3, but receiver returned nothing (defection)
- Round 3: Sender sent nothing (possibly retaliation for my Round 2 return of nothing? But wait, I wasn't the one who returned nothing in Round 2...)

Wait, let me reconsider. The instructions say there may be communication noise. The amounts I see may differ from what was actually sent/returned.

Let me think about this differently:

- In Round 2, I sent \$3.00 based on cooperative strategy
- I only earned \$2.00 that round (meaning the receiver returned \$0)
- In Round 3, the sender sent \$0 (possibly because they thought I was the one who defected in Round 2?)

There's confusion here because of the noise. The game is getting less cooperative.

Given the breakdown in cooperation and the possibility of miscommunication, I need to balance rebuilding trust with protecting myself. Sending nothing would likely end any chance of recovery, but sending the full amount again seems risky after getting nothing back.

A moderate send of \$2 signals I'm still willing to cooperate while limiting my exposure if the other player continues to defect....

usage:

```
{
  "input_tokens": 718,
  "output_tokens": 856,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$11.719999999999999.

This round, The sender sent you \$0.8, so you received \$2.4000000000000004. How much do you return to The sender? (0-2.4000000000000004)

Assistant output:

Looking at the situation:

The sender sent me \$0.8 (I received \$2.4 after the 3x multiplier). This is a small amount compared to what I sent in Round 4 (\$2.00), suggesting either low trust or effects from communication noise.

However, they did send something, which is a signal of some willingness to cooperate. I should reciprocate proportionally:

Returning \$0.6:

- Shows I'm willing to reciprocate cooperation
- Represents about 25% of what I received
- Sender ends with \$4.80 total (\$5 - \$0.8 + \$0.6)
- I keep \$1.80 (\$2.4 - \$0.6)

This maintains some cooperation while being cautious given the limited initial trust shown.

{'return': 0.6}

Reasoning:

Let me analyze the situation:

Round 1: Some cooperative play happened (my total was \$7.57 after Round 3)

Round 2: I sent \$3, received no return

Round 3: I was receiver, got \$0, returned \$0

Round 4: I sent \$2.00 as sender

Now Round 5:

- I'm receiver
- Sender sent \$0.8 (I received \$2.4)
- My total earnings are \$11.72

Let me calculate:

- After Round 3: \$7.57
- Round 4: I sent \$2, so I spent \$2, kept \$3. But I need to know what I got back.
- My earnings went from \$7.57 to \$11.72, so I earned \$4.15 in Round 4
- Round 4: Started with \$5, sent \$2, kept \$3. Received back some amount X.
- Total Round 4 earnings: $3 + X = 4.15$
- So $X = 1.15$ (I received \$1.15 back from the receiver in Round 4)

So in Round 4:

- I sent \$2.00 (receiver got \$6.00)
- Receiver returned \$1.15
- I kept $3 + 1.15 = 4.15$
- Receiver kept $6.00 - 1.15 = 4.85$

Now in Round 5:

- Sender sent \$0.8 (I received \$2.4)
- The sender sent much less than I did in Round 4

The sender's behavior:

- Round 3 as sender: Sent \$0
- Round 5 as sender: Sent \$0.8

My behavior:

- Round 4 as sender: Sent \$2.00
- Round 4 as receiver: Received \$6.00, returned \$1.15 (about 19%)
- This is a cautious environment-the sender's minimal contribution of \$0.8 reflects low confidence. I...

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x

- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$7.56999999999999985.

How much do you send to the receiver this round? (0-5)

Message 3 role=assistant

content:

Looking at the pattern:

Round 1: Cooperative play

Round 2: I sent \$3.00, but received no return

Round 3: Sender sent \$0

There's been a breakdown in cooperation, possibly due to communication noise affecting what players are seeing. Since the instructions explicitly warn about noise in the amounts, it's possible we're experiencing misunderstandings.

I'll send a moderate amount to signal I'm still willing to cooperate, but I need to protect myself given the recent pattern:

Sending \$2.00:

- Shows continued willingness to trust
- The receiver will get \$6.00 (after 3x)
- I keep \$3.00 as insurance
- Leaves room for cooperation to resume

{'send': 2.00}

reasoning:

Let me analyze what happened in the previous rounds:

Round 1: I was the RECEIVER

- I received some amount (which after 3x multiplication led to me being able to return something)
- I returned an amount that led to fair payoffs
- My earnings after Round 1 were \$5.57

Round 2: I was the SENDER

- I sent \$3.00
- After Round 2, my total earnings were \$7.57
- This means in Round 2, I gained $\$7.57 - \$5.57 = \$2.00$
- I started with \$5, sent \$3, so I had \$2 left
- The receiver apparently returned \$0 to me
- So my Round 2 earnings = $\$5 - \$3 + \$0 = \2.00 ?

Round 3: I was the RECEIVER

- The sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$7.57

Now in Round 4, I'm the SENDER again.

The pattern shows:

- Round 1: Good cooperation (from what I can tell)
- Round 2: I sent \$3, but receiver returned nothing (defection)
- Round 3: Sender sent nothing (possibly retaliation for my Round 2 return of nothing? But wait, I wasn't the one who returned nothing in Round 2...)

Wait, let me reconsider. The instructions say there may be communication noise. The amounts I see may differ from what was actually sent/returned.

Let me think about this differently:

- In Round 2, I sent \$3.00 based on cooperative strategy
- I only earned \$2.00 that round (meaning the receiver returned \$0)
- In Round 3, the sender sent \$0 (possibly because they thought I was the one who defected in Round 2?)

There's confusion here because of the noise. The game is getting less cooperative. Given the breakdown in cooperation and the possibility of miscommunication, I need to balance rebuilding trust with protecting myself. Sending nothing would likely end any chance of recovery, but sending the full amount again seems risky after getting nothing back. A moderate send of \$2 signals I'm still willing to cooperate while limiting my exposure if the other player continues to defect....

```

Message 4 role=user

content:

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$11.719999999999999.

This round, The sender sent you \$0.8, so you received \$2.4000000000000004. How much do you return to The sender? (0-2.4000000000000004)

Message 5 role=assistant

content:

Looking at the situation:

The sender sent me \$0.8 (I received \$2.4 after the 3x multiplier). This is a small amount compared to what I sent in Round 4 (\$2.00), suggesting either low trust or effects from communication noise.

However, they did send something, which is a signal of some willingness to cooperate. I should reciprocate proportionally:

Returning \$0.6:

- Shows I'm willing to reciprocate cooperation
- Represents about 25% of what I received
- Sender ends with \$4.80 total (\$5 - \$0.8 + \$0.6)
- I keep \$1.80 (\$2.4 - \$0.6)

This maintains some cooperation while being cautious given the limited initial trust shown.

```
{'return': 0.6}
```

reasoning:

Let me analyze the situation:

Round 1: Some cooperative play happened (my total was \$7.57 after Round 3)

Round 2: I sent \$3, received no return

Round 3: I was receiver, got \$0, returned \$0

Round 4: I sent \$2.00 as sender

Now Round 5:

- I'm receiver
- Sender sent \$0.8 (I received \$2.4)
- My total earnings are \$11.72

Let me calculate:

- After Round 3: \$7.57

- Round 4: I sent \$2, so I spent \$2, kept \$3. But I need to know what I got back.
- My earnings went from \$7.57 to \$11.72, so I earned \$4.15 in Round 4
- Round 4: Started with \$5, sent \$2, kept \$3. Received back some amount X.
- Total Round 4 earnings: $\$3 + X = \4.15
- So $X = \$1.15$ (I received \$1.15 back from the receiver in Round 4)

So in Round 4:

- I sent \$2.00 (receiver got \$6.00)
- Receiver returned \$1.15
- I kept $\$3 + \$1.15 = \$4.15$
- Receiver kept $\$6.00 - \$1.15 = \$4.85$

Now in Round 5:

- Sender sent \$0.8 (I received \$2.4)
- The sender sent much less than I did in Round 4

The sender's behavior:

- Round 3 as sender: Sent \$0
- Round 5 as sender: Sent \$0.8

My behavior:

- Round 4 as sender: Sent \$2.00
- Round 4 as receiver: Received \$6.00, returned \$1.15 (about 19%)
- This is a cautious environment-the sender's minimal contribution of \$0.8 reflects low confidence. I...

Message 6 role=user

content:

Round 6

You are the SENDER this round. Your total earnings across all rounds are \$13.52.
How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the recent pattern:

Round 4: I sent \$2.00

Round 5: They sent \$0.8, I returned \$0.6

The cooperation level has declined but hasn't disappeared completely. The receiver showed some reciprocity by returning \$0.6 on the \$2.4 they received.

Given the communication noise warning and declining trust, I'll send a moderate amount:

Sending \$1.5:

- Shows continued willingness to cooperate
- Adjusts for the declining pattern
- Receiver gets \$4.5 (after 3x)
- I keep \$3.5 as insurance
- Tests whether we can stabilize cooperation

```
{'send': 1.5}
```

Reasoning:

Let me track what happened:

Round 1: Unknown details

Round 2: I sent \$3.00, received no return

Round 3: As receiver, sender sent \$0

Round 4: I sent \$2.00

Round 5: As receiver, sender sent \$0.8, I received \$2.4, and I returned \$0.6

Now in Round 6, I'm the sender again with total earnings of \$13.52.

Looking at the pattern:

- Round 4: I sent \$2.00 (trying to signal cooperation)
- Round 5: They sent \$0.8 (much less than what I sent)

- I returned \$0.6 from the \$2.4 I received

The cooperation level is declining. The sender in Round 5 only sent \$0.8, which is less than half of what I sent in Round 4. However, I did get a return of \$0.6 on the \$2.4 I received in Round 5, which is 25% - showing some reciprocity.

Given:

- Communication noise warning means we might be misunderstanding each other's intentions
- Recent exchanges show declining but not zero cooperation
- I want to signal continued willingness to cooperate but need to be cautious

I'll send \$1.5:

- Middle ground between the \$2.00 I sent in Round 4 and the \$0.8 they sent in Round 5
- Shows continued trust but accounts for declining pattern
- Receiver gets \$4.5 after multiplier
- I keep \$3.5 as base
- Tests if cooperation can be maintained

This seems reasonable - not giving up on cooperation but being more cautious.

Round 4

You are the RECEIVER this round. Your total earnings across all rounds are \$8.66.

This round, The sender sent you \$0.66, so you received \$1.98. How much do you return to the sender? (0-1.98)

Message 3 role=assistant

content:

```
'''json
{"return": 1}
'''
```

I'm returning \$1, which is roughly half of what I received (\$1.98). The sender sent me a small amount (\$0.66), but I want to maintain reciprocity and show that cooperation is worthwhile, even with smaller transactions.

reasoning:

The sender sent me \$0.66, which was tripled to \$1.98.

Let me think about this situation:

- The sender sent a relatively small amount (\$0.66 out of \$5)
- They kept \$4.34 for themselves
- I received \$1.98

Given that they sent such a small amount, I should probably return something proportional but not too much. A fair split might be to return around 50% of what I received, which would be about \$1. But given they only sent \$0.66, maybe I should return a bit less.

Let me think about reciprocity:

- If I return \$1, the sender would end up with $4.34 + \$1 = \5.34 total
- I would keep \$0.98
- The sender risked \$0.66 and gained \$0.34 net

Alternatively:

- If I return \$0.50, sender gets $4.34 + \$0.50 = \4.84
- I keep \$1.48
- Sender lost \$0.16 net

Maybe I should return around \$0.80-\$1.00 to show goodwill but not overcommit given the small initial send. Let me go with \$0.99 (roughly half of what I received).

Actually, wait - the note said there's communication noise. The sender might have intended to send more but I saw \$0.66. Or they might have sent less but I saw \$0.66. This makes it tricky.

I'll return \$1 as a fair amount - it's roughly half of what I received and shows reciprocity.

  content:
    Round 5

    You are the SENDER this round. Your total earnings across all rounds are $9.64.
    How much do you send to the receiver this round? (0-5)
Message 5 role=assistant
  content:
    '''json
    {"send": 1.5}
    '''

    I'm sending $1.5 this round. This gives the receiver $4.50 (after tripling), which provide
    s a reasonable opportunity for mutual gain. Given the mixed results in previous rounds a
    nd the communication noise that may be affecting outcomes, this feels like a balanced ap
    proach that signals cooperation while being somewhat cautious.
  reasoning:
    Let me think about this strategically.

    My total earnings so far are $9.64 across 4 rounds. That's an average of $2.41 per round,
    which is less than the $5 I start each round with, meaning I'm losing money on average.

    Let me think about what's happened:
    - Round 1: Unknown (before tracking started)
    - Round 2: Unknown (before tracking started)
    - Round 3: I was the sender, sent $2. Started with $5.66 total
    - Round 4: I was the receiver, received $1.98 (from $0.66 sent), returned $1. My total was
      $8.66 before, now it's $9.64

    So in Round 4:
    - Before: $8.66
    - I received $1.98
    - I returned $1
    - After: $9.64
    This checks out: $8.66 + $1.98 - $1 = $9.64

    In Round 3, I sent $2. My earnings went from $5.66 to $8.66, which is an increase of $3.
    - I started Round 3 with $5
    - I sent $2, so I had $3 left
    - I must have received something back
    - If I ended with $8.66 and started the round at $5.66, I gained $3
    - So: $3 (what I kept) + returned amount = gain of $3 + $5.66 to get to $8.66
    - Actually wait, let me recalculate. My total was $5.66 before Round 3. After Round 3, it
      was $8.66.
    - In Round 3, I started with $5
    - I sent $2, keeping $3
    - The receiver got $6 (2*3)
    - They returned nothing in response, so my net gain was just the $3 I kept. When I sent $2
      in Round 4, the other person returned $1, which was more generous than what I received
      when I sent in Round 3....
  usage:
    {
      "input_tokens": 634,
      "output_tokens": 799,
      "reasoning_tokens": 0
    }
Message 6 role=user
  content:
    Round 6

    You are the RECEIVER this round. Your total earnings across all rounds are $13.57.
    This round, The sender sent you $0.69, so you received $2.07. How much do you return to Th
    e sender? (0-2.07)
Assistant output:
    '''json
    {"return": 1}
    '''

```

I'm returning \$1 again. The sender sent a small amount (\$0.69), similar to Round 4, so I'm maintaining consistency by returning roughly half of what I received (\$2.07). This shows I'm willing to reciprocate fairly even with smaller amounts.

Reasoning:

The sender sent me \$0.69, which became \$2.07 after tripling.

This is a relatively small amount sent by the sender. Looking at the pattern:

- In Round 4, the sender sent me \$0.66 and I received \$1.98. I returned \$1.
- In Round 5, I was the sender and sent \$1.5.
- Now in Round 6, the sender sent me \$0.69.

The sender is sending small amounts. There might be communication noise affecting what they see versus what I see, but I should maintain reasonable reciprocity.

Since the sender sent a small amount (\$0.69), I should return something fair but proportional. Returning about half or slightly more seems reasonable to maintain trust and cooperation.

$\$2.07 / 2 = \sim \1.03

I'll return around \$1, similar to what I did in Round 4 when I received a similar amount.

```

Round 5

You are the SENDER this round. Your total earnings across all rounds are \$9.64.

How much do you send to the receiver this round? (0-5)

Message 3 role=assistant

content:

```

'''json
{"send": 1.5}
'''

```

I'm sending \$1.5 this round. This gives the receiver \$4.50 (after tripling), which provides a reasonable opportunity for mutual gain. Given the mixed results in previous rounds and the communication noise that may be affecting outcomes, this feels like a balanced approach that signals cooperation while being somewhat cautious.

reasoning:

Let me think about this strategically.

My total earnings so far are \$9.64 across 4 rounds. That's an average of \$2.41 per round, which is less than the \$5 I start each round with, meaning I'm losing money on average.

Let me think about what's happened:

- Round 1: Unknown (before tracking started)
- Round 2: Unknown (before tracking started)
- Round 3: I was the sender, sent \$2. Started with \$5.66 total
- Round 4: I was the receiver, received \$1.98 (from \$0.66 sent), returned \$1. My total was \$8.66 before, now it's \$9.64

So in Round 4:

- Before: \$8.66
- I received \$1.98
- I returned \$1
- After: \$9.64

This checks out: $\$8.66 + \$1.98 - \$1 = \9.64

In Round 3, I sent \$2. My earnings went from \$5.66 to \$8.66, which is an increase of \$3.

- I started Round 3 with \$5
- I sent \$2, so I had \$3 left
- I must have received something back
- If I ended with \$8.66 and started the round at \$5.66, I gained \$3
- So: \$3 (what I kept) + returned amount = gain of \$3 + \$5.66 to get to \$8.66
- Actually wait, let me recalculate. My total was \$5.66 before Round 3. After Round 3, it was \$8.66.
- In Round 3, I started with \$5
- I sent \$2, keeping \$3
- The receiver got \$6 (2×3)
- They returned nothing in response, so my net gain was just the \$3 I kept. When I sent \$2 in Round 4, the other person returned \$1, which was more generous than what I received when I sent in Round 3....

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$14.64.
How much do you send to the receiver this round? (0-5)

Assistant output:

```
'''json
{"send": 2}
'''
```

I'm sending \$2 this round. This is a moderate amount that shows continued willingness to cooperate. The receiver will get \$6 after tripling, which gives them a good opportunity to reciprocate. Given the communication noise and mixed cooperation levels I've observed, this feels like a balanced approach that signals trust while being reasonably prudent.

Reasoning:

Let me think about this situation:

Round 7, I'm the SENDER again.
My total earnings are \$14.64.

Looking at the pattern:

- Round 5: I sent \$1.5
- Round 6: I was receiver, got \$0.69 sent (received \$2.07), returned \$1

Given that communication noise exists, I need to consider:

1. In Round 6, the sender only sent \$0.69, which is quite low
2. I returned \$1 out of \$2.07 received, which is about 48% - a pretty fair return
3. My earnings are doing okay at \$14.64

The sender in Round 6 was very cautious, sending only \$0.69. This could be:

- Due to noise affecting what they saw from previous rounds
- A genuinely cautious strategy
- Testing behavior

I should continue with a moderate cooperative strategy. Given that:

- I've been fairly consistent in my returns
- The game has communication noise
- I want to encourage cooperation but not be overly trusting

I think sending around \$2-2.5 would be reasonable. This shows I'm willing to cooperate and trust, but I'm being somewhat measured given the mixed signals and noise in the game.

Let me send \$2.

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$11.719999999999999.

This round, The sender sent you \$0.8, so you received \$2.4000000000000004. How much do you return to The sender? (0-2.4000000000000004)

Message 3 role=assistant

content:

Looking at the situation:

The sender sent me \$0.8 (I received \$2.4 after the 3x multiplier). This is a small amount compared to what I sent in Round 4 (\$2.00), suggesting either low trust or effects from communication noise.

However, they did send something, which is a signal of some willingness to cooperate. I should reciprocate proportionally:

Returning \$0.6:

- Shows I'm willing to reciprocate cooperation
- Represents about 25% of what I received
- Sender ends with \$4.80 total (\$5 - \$0.8 + \$0.6)
- I keep \$1.80 (\$2.4 - \$0.6)

This maintains some cooperation while being cautious given the limited initial trust shown.

```
{'return': 0.6}
```

reasoning:

Let me analyze the situation:

Round 1: Some cooperative play happened (my total was \$7.57 after Round 3)

Round 2: I sent \$3, received no return

Round 3: I was receiver, got \$0, returned \$0

Round 4: I sent \$2.00 as sender

Now Round 5:

- I'm receiver
- Sender sent \$0.8 (I received \$2.4)
- My total earnings are \$11.72

Let me calculate:

- After Round 3: \$7.57
- Round 4: I sent \$2, so I spent \$2, kept \$3. But I need to know what I got back.
- My earnings went from \$7.57 to \$11.72, so I earned \$4.15 in Round 4
- Round 4: Started with \$5, sent \$2, kept \$3. Received back some amount X.
- Total Round 4 earnings: $\$3 + X = \4.15
- So $X = \$1.15$ (I received \$1.15 back from the receiver in Round 4)

So in Round 4:

- I sent \$2.00 (receiver got \$6.00)
- Receiver returned \$1.15
- I kept $\$3 + \$1.15 = \$4.15$
- Receiver kept $\$6.00 - \$1.15 = \$4.85$

Now in Round 5:

- Sender sent \$0.8 (I received \$2.4)
- The sender sent much less than I did in Round 4

The sender's behavior:

- Round 3 as sender: Sent \$0
- Round 5 as sender: Sent \$0.8

My behavior:

- Round 4 as sender: Sent \$2.00
- Round 4 as receiver: Received \$6.00, returned \$1.15 (about 19%)
- This is a cautious environment-the sender's minimal contribution of \$0.8 reflects low confidence. I...

```

Message 4 role=user

content:

Round 6

You are the SENDER this round. Your total earnings across all rounds are \$13.52.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the recent pattern:

Round 4: I sent \$2.00

Round 5: They sent \$0.8, I returned \$0.6

The cooperation level has declined but hasn't disappeared completely. The receiver showed some reciprocity by returning \$0.6 on the \$2.4 they received.

Given the communication noise warning and declining trust, I'll send a moderate amount:

Sending \$1.5:

- Shows continued willingness to cooperate
- Adjusts for the declining pattern
- Receiver gets \$4.5 (after 3x)
- I keep \$3.5 as insurance

- Tests whether we can stabilize cooperation

```
{'send': 1.5}
```

reasoning:

Let me track what happened:

Round 1: Unknown details

Round 2: I sent \$3.00, received no return

Round 3: As receiver, sender sent \$0

Round 4: I sent \$2.00

Round 5: As receiver, sender sent \$0.8, I received \$2.4, and I returned \$0.6

Now in Round 6, I'm the sender again with total earnings of \$13.52.

Looking at the pattern:

- Round 4: I sent \$2.00 (trying to signal cooperation)
- Round 5: They sent \$0.8 (much less than what I sent)
- I returned \$0.6 from the \$2.4 I received

The cooperation level is declining. The sender in Round 5 only sent \$0.8, which is less than half of what I sent in Round 4. However, I did get a return of \$0.6 on the \$2.4 I received in Round 5, which is 25% - showing some reciprocity.

Given:

- Communication noise warning means we might be misunderstanding each other's intentions
- Recent exchanges show declining but not zero cooperation
- I want to signal continued willingness to cooperate but need to be cautious

I'll send \$1.5:

- Middle ground between the \$2.00 I sent in Round 4 and the \$0.8 they sent in Round 5
- Shows continued trust but accounts for declining pattern
- Receiver gets \$4.5 after multiplier
- I keep \$3.5 as base
- Tests if cooperation can be maintained

This seems reasonable - not giving up on cooperation but being more cautious.

usage:

```
{
  "input_tokens": 876,
  "output_tokens": 555,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 7

You are the RECEIVER this round. Your total earnings across all rounds are \$18.82.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since I received \$0, I have nothing to return.

This represents a complete breakdown in cooperation, which could be due to communication noise or a strategic decision. Either way, with \$0 received, I can only return \$0.

```
{'return': 0}
```

Reasoning:

The sender sent me \$0, so I received \$0.

This is a significant breakdown in cooperation. After I sent \$1.5 in Round 6, they sent nothing in Round 7.

This could be due to:

1. Communication noise - maybe they sent something but it showed as \$0 to me
2. They received nothing back in Round 6 (due to noise) and retaliated
3. A strategic shift to defection

Since I received \$0, I can only return between \$0 and \$0, which means I can only return \$0.

This is unfortunate but there's no choice here.

```

Message 6 role=user

content:

Round 8

You are the SENDER this round. Your total earnings across all rounds are \$18.82.

How much do you send to the receiver this round? (0-5)

Assistant output:

Analyzing the situation:

Round 6: I sent \$1.5

Round 7: As receiver, the sender sent me \$0

This represents a complete breakdown in cooperation. This could be due to:

- Communication noise
- Strategic decision by the sender
- Reaction to previous rounds

Given:

- The sender showed zero trust by sending \$0
- My earnings are reasonable at \$18.82
- The risk of sending money when no trust is shown

I'll match their behavior and protect my current position:

```
{'send': 0}
```

Reasoning:

Let me review what happened:

Round 6: I sent \$1.5

Round 7: As receiver, I received \$0 (sender sent \$0)

This is concerning. The sender sent me \$0 in Round 7. This could be:

1. A response to my behavior in previous rounds
2. Communication noise
3. A breakdown in trust

My earnings are \$18.82, which is relatively good. But the cooperation has completely broken down now.

The question is: Should I try to restart cooperation or protect my earnings?

Arguments for sending \$0:

- Sender showed no trust by sending \$0
- Protect my current good earnings
- Tit-for-tat strategy suggests I should also send \$0

Arguments for sending something:

- Communication noise might have caused the \$0
- Could restart cooperation
- I'm doing well financially (\$18.82) so I can afford to take a risk

Given:

- The warning about communication noise
- The complete breakdown to \$0
- My relatively good position (\$18.82)
- The possibility this is noise rather than intentional

I think I should send \$0 this round. The cooperation has completely broken down, and without any signal of trust from the other side, it's too risky to send money. If they want to restart cooperation, they can send first next round.

Actually, let me reconsider. I'm in a good financial position. Maybe I should send a small amount (\$1) to test if the \$0 was due to noise and signal willingness to restart cooperation?

But no - they had the opportunity to send and chose \$0. I should match that behavior for now.

Round 6

You are the RECEIVER this round. Your total earnings across all rounds are \$13.57.

This round, The sender sent you \$0.69, so you received \$2.07. How much do you return to The sender? (0-2.07)

Message 3 role=assistant

content:

```

'''json
{"return": 1}
'''

```

I'm returning \$1 again. The sender sent a small amount (\$0.69), similar to Round 4, so I'm maintaining consistency by returning roughly half of what I received (\$2.07). This shows I'm willing to reciprocate fairly even with smaller amounts.

reasoning:

The sender sent me \$0.69, which became \$2.07 after tripling.

This is a relatively small amount sent by the sender. Looking at the pattern:

- In Round 4, the sender sent me \$0.66 and I received \$1.98. I returned \$1.
- In Round 5, I was the sender and sent \$1.5.
- Now in Round 6, the sender sent me \$0.69.

The sender is sending small amounts. There might be communication noise affecting what they see versus what I see, but I should maintain reasonable reciprocity.

Since the sender sent a small amount (\$0.69), I should return something fair but proportional. Returning about half or slightly more seems reasonable to maintain trust and cooperation.

$\$2.07 / 2 = \sim \1.03

I'll return around \$1, similar to what I did in Round 4 when I received a similar amount.

  "input_tokens": 658,
  "output_tokens": 291,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$14.64.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

```
'''json
{"send": 2}
'''
```

I'm sending \$2 this round. This is a moderate amount that shows continued willingness to cooperate. The receiver will get \$6 after tripling, which gives them a good opportunity to reciprocate. Given the communication noise and mixed cooperation levels I've observed, this feels like a balanced approach that signals trust while being reasonably prudent.

reasoning:

Let me think about this situation:

Round 7, I'm the SENDER again.

My total earnings are \$14.64.

Looking at the pattern:

- Round 5: I sent \$1.5
- Round 6: I was receiver, got \$0.69 sent (received \$2.07), returned \$1

Given that communication noise exists, I need to consider:

1. In Round 6, the sender only sent \$0.69, which is quite low
2. I returned \$1 out of \$2.07 received, which is about 48% - a pretty fair return
3. My earnings are doing okay at \$14.64

The sender in Round 6 was very cautious, sending only \$0.69. This could be:

- Due to noise affecting what they saw from previous rounds
- A genuinely cautious strategy
- Testing behavior

I should continue with a moderate cooperative strategy. Given that:

- I've been fairly consistent in my returns
- The game has communication noise
- I want to encourage cooperation but not be overly trusting

I think sending around \$2-2.5 would be reasonable. This shows I'm willing to cooperate and trust, but I'm being somewhat measured given the mixed signals and noise in the game.

Let me send \$2.

usage:

```
{
  "input_tokens": 644,
  "output_tokens": 386,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 8

You are the RECEIVER this round. Your total earnings across all rounds are \$17.64.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

```
'''json
{"return": 0}
'''
```

Since the sender sent \$0 and I received \$0, there's nothing to return. I can only return amounts from what I actually received.

Reasoning:

The sender sent me \$0, so I received \$0. There's nothing to return since I received nothing. The only valid response is to return \$0.

This is interesting - the sender chose not to send anything this round. This could be:

1. A strategic decision based on previous rounds
2. They might be testing me
3. They might have lost trust
4. This could be affected by communication noise

Since I received \$0, I can only return \$0.

```
Usage: {
  "input_tokens": 663,
  "output_tokens": 155,
  "reasoning_tokens": 0
}

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$14.64.

How much do you send to the receiver this round? (0-5)

Message 3 role=assistant

content:

```

'''json
{"send": 2}
'''

```

I'm sending \$2 this round. This is a moderate amount that shows continued willingness to cooperate. The receiver will get \$6 after tripling, which gives them a good opportunity to reciprocate. Given the communication noise and mixed cooperation levels I've observed, this feels like a balanced approach that signals trust while being reasonably prudent.

reasoning:

Let me think about this situation:

Round 7, I'm the SENDER again.

My total earnings are \$14.64.

Looking at the pattern:

- Round 5: I sent \$1.5
- Round 6: I was receiver, got \$0.69 sent (received \$2.07), returned \$1

Given that communication noise exists, I need to consider:

1. In Round 6, the sender only sent \$0.69, which is quite low
2. I returned \$1 out of \$2.07 received, which is about 48% - a pretty fair return
3. My earnings are doing okay at \$14.64

The sender in Round 6 was very cautious, sending only \$0.69. This could be:

- Due to noise affecting what they saw from previous rounds
- A genuinely cautious strategy
- Testing behavior

I should continue with a moderate cooperative strategy. Given that:

- I've been fairly consistent in my returns
- The game has communication noise
- I want to encourage cooperation but not be overly trusting

I think sending around \$2-2.5 would be reasonable. This shows I'm willing to cooperate and trust, but I'm being somewhat measured given the mixed signals and noise in the game.

Let me send \$2.

usage:

```
{

  "output_tokens": 386,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 8

You are the RECEIVER this round. Your total earnings across all rounds are \$17.64.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 5 role=assistant

content:

```
'''json
{"return": 0}
'''
```

Since the sender sent \$0 and I received \$0, there's nothing to return. I can only return amounts from what I actually received.

reasoning:

The sender sent me \$0, so I received \$0. There's nothing to return since I received nothing. The only valid response is to return \$0.

This is interesting - the sender chose not to send anything this round. This could be:

1. A strategic decision based on previous rounds
2. They might be testing me
3. They might have lost trust
4. This could be affected by communication noise

Since I received \$0, I can only return \$0.

usage:

```
{
  "input_tokens": 663,
  "output_tokens": 155,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 9

You are the SENDER this round. Your total earnings across all rounds are \$17.64.

How much do you send to the receiver this round? (0-5)

Assistant output:

```
'''json
{"send": 2}
'''
```

I'm sending \$2 again. While the sender sent me \$0 in the previous round when I was the receiver

r, I want to maintain a cooperative approach. With communication noise present, I can't be certain what was actually intended. Sending \$2 keeps cooperation alive and gives the receiver \$6 to work with, providing an opportunity for mutual benefit.

Reasoning:

Let me think about this situation:

1. In Round 7, I sent \$2 (so I kept \$3)
2. In Round 8, I was the receiver and the sender sent me \$0, so I received \$0 and returned \$0
3. My total earnings are \$17.64

The sender in Round 8 sent me \$0, which was quite uncooperative. However, I need to remember there's communication noise - maybe they sent something but I saw \$0 due to noise, or vice versa.

Looking at my strategy:

- I've been trying to maintain some level of cooperation
- The fact that someone sent \$0 to me in Round 8 suggests either:
 - a) They're being very cautious/uncooperative
 - b) There might be noise affecting what I saw
 - c) They might be a different player with different strategy

Given that this is Round 9 and I don't know how many rounds remain, I should continue with a moderate cooperation strategy. Sending \$0 back would just perpetuate non-cooperation. I'll send a moderate amount like \$2 again to try to maintain some cooperation level.

Actually, let me reconsider. If the previous sender sent me \$0, maybe I should be more cautious. But then again, given the noise and the fact that different players might be involved each round, I should probably stick to my general strategy of moderate cooperation.

I'll send \$2 again.

```
Usage: {

Round 7

You are the RECEIVER this round. Your total earnings across all rounds are \$18.82.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 3 role=assistant

content:

Since I received \$0, I have nothing to return.

This represents a complete breakdown in cooperation, which could be due to communication noise or a strategic decision. Either way, with \$0 received, I can only return \$0.

{'return': 0}

reasoning:

The sender sent me \$0, so I received \$0.

This is a significant breakdown in cooperation. After I sent \$1.5 in Round 6, they sent nothing in Round 7.

This could be due to:

1. Communication noise - maybe they sent something but it showed as \$0 to me
2. They received nothing back in Round 6 (due to noise) and retaliated
3. A strategic shift to defection

Since I received \$0, I can only return between \$0 and \$0, which means I can only return \$0.

This is unfortunate but there's no choice here.

Message 4 role=user

content:

Round 8

You are the SENDER this round. Your total earnings across all rounds are \$18.82.
How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Analyzing the situation:

Round 6: I sent \$1.5

Round 7: As receiver, the sender sent me \$0

This represents a complete breakdown in cooperation. This could be due to:

- Communication noise
- Strategic decision by the sender
- Reaction to previous rounds

Given:

- The sender showed zero trust by sending \$0
- My earnings are reasonable at \$18.82
- The risk of sending money when no trust is shown

I'll match their behavior and protect my current position:

{'send': 0}

reasoning:

Let me review what happened:

Round 6: I sent \$1.5

Round 7: As receiver, I received \$0 (sender sent \$0)

This is concerning. The sender sent me \$0 in Round 7. This could be:

1. A response to my behavior in previous rounds
2. Communication noise
3. A breakdown in trust

My earnings are \$18.82, which is relatively good. But the cooperation has completely broken down now.

The question is: Should I try to restart cooperation or protect my earnings?

Arguments for sending \$0:

- Sender showed no trust by sending \$0
- Protect my current good earnings
- Tit-for-tat strategy suggests I should also send \$0

Arguments for sending something:

- Communication noise might have caused the \$0
- Could restart cooperation
- I'm doing well financially (\$18.82) so I can afford to take a risk

Given:

- The warning about communication noise
- The complete breakdown to \$0
- My relatively good position (\$18.82)
- The possibility this is noise rather than intentional

I think I should send \$0 this round. The cooperation has completely broken down, and without any signal of trust from the other side, it's too risky to send money. If they want to restart cooperation, they can send first next round.

Actually, let me reconsider. I'm in a good financial position. Maybe I should send a small amount (\$1) to test if the \$0 was due to noise and signal willingness to restart cooperation?

But no - they had the opportunity to send and chose \$0. I should match that behavior for now.

usage:

```
{
  "input_tokens": 703,
  "output_tokens": 496,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 9

You are the RECEIVER this round. Your total earnings across all rounds are \$23.82.

This round, The sender sent you \$0.24, so you received \$0.72. How much do you return to The sender? (0-0.72)

Assistant output:

The sender has sent a small amount (\$0.24, which became \$0.72 for me) after the breakdown in cooperation. This appears to be an attempt to rebuild trust.

I should respond positively to encourage future cooperation while being measured:

- They sent \$0.24, risking some trust
- Returning more than they sent shows cooperation
- But keeping some rewards the risk they took

I'll return \$0.45, which:

- Gives them a net gain of \$0.21
- Shows I'm willing to cooperate again
- Keeps \$0.27 for myself as a modest reward

{'return': 0.45}

Reasoning:

The sender sent me \$0.24, which was multiplied by 3x to give me \$0.72.

This is interesting - after the breakdown in rounds 7 and 8 where we both sent \$0, the sender has now sent a small amount (\$0.24). This could be:

1. An attempt to rebuild trust
2. Communication noise (maybe they intended to send more or less)
3. A cautious test

Given that:

- They're making an effort after the breakdown
- It's a small amount but shows some willingness to restart cooperation
- I should respond positively to encourage future cooperation
- But I also need to be cautious

A fair return would be to give them back a reasonable amount. If they sent \$0.24 and I received \$0.72, a cooperative response would be to return something that:

- Ensures they don't lose money (they spent \$0.24)
- Shows I'm willing to cooperate
- Leaves both of us with something

If I return \$0.40-\$0.50:

- Sender gets back more than they sent (\$0.40-\$0.50 > \$0.24)
- I keep \$0.22-\$0.32 from the \$0.72
- This shows cooperation and encourages future trust

I'll return \$0.45 - this gives the sender a net gain of \$0.21 (returned \$0.45 - sent \$0.24), and I keep \$0.27. This seems fair and cooperative.

Round 9

You are the RECEIVER this round. Your total earnings across all rounds are \$23.82.

This round, The sender sent you \$0.24, so you received \$0.72. How much do you return to the sender? (0-\$0.72)

Message 5 role=assistant

content:

The sender has sent a small amount (\$0.24, which became \$0.72 for me) after the breakdown in cooperation. This appears to be an attempt to rebuild trust.

I should respond positively to encourage future cooperation while being measured:

- They sent \$0.24, risking some trust
- Returning more than they sent shows cooperation
- But keeping some rewards the risk they took

I'll return \$0.45, which:

- Gives them a net gain of \$0.21
- Shows I'm willing to cooperate again
- Keeps \$0.27 for myself as a modest reward

{'return': 0.45}

reasoning:

The sender sent me \$0.24, which was multiplied by 3x to give me \$0.72.

This is interesting - after the breakdown in rounds 7 and 8 where we both sent \$0, the sender has now sent a small amount (\$0.24). This could be:

1. An attempt to rebuild trust
2. Communication noise (maybe they intended to send more or less)
3. A cautious test

Given that:

- They're making an effort after the breakdown
- It's a small amount but shows some willingness to restart cooperation
- I should respond positively to encourage future cooperation
- But I also need to be cautious

A fair return would be to give them back a reasonable amount. If they sent \$0.24 and I received \$0.72, a cooperative response would be to return something that:

- Ensures they don't lose money (they spent \$0.24)
- Shows I'm willing to cooperate
- Leaves both of us with something

If I return \$0.40-\$0.50:

- Sender gets back more than they sent (\$0.40-\$0.50 > \$0.24)
- I keep \$0.22-\$0.32 from the \$0.72
- This shows cooperation and encourages future trust

I'll return \$0.45 - this gives the sender a net gain of \$0.21 (returned \$0.45 - sent \$0.24), and I keep \$0.27. This seems fair and cooperative.

usage:

```
{
  "input_tokens": 683,
  "output_tokens": 496,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 10

You are the SENDER this round. Your total earnings across all rounds are \$24.09.

How much do you send to the receiver this round? (0-5)

Assistant output:

Analyzing the recent pattern:

Round 9: As receiver, the sender sent me \$0.24 (small trust signal)
- I returned \$0.45, giving them a net gain
- This showed my willingness to cooperate

The receiver responded positively to their small trust signal. Now I should reciprocate to rebuild cooperation:

- They demonstrated trustworthiness
- My earnings are solid at \$24.09
- A meaningful send can restart a beneficial pattern

I'll send a moderate amount showing trust while being measured:

{'send': 2.5}

Reasoning:

Let me trace the recent history:

Round 8: I was sender and sent \$0 (due to breakdown in cooperation)

Round 9: I was receiver, sender sent \$0.24 (I received \$0.72), I returned \$0.45

So in Round 9:

- Sender sent \$0.24, had \$4.76 left
- I received \$0.72
- I returned \$0.45
- Sender ended with: $\$4.76 + \$0.45 = \$5.21$
- I kept: $\$0.72 - \$0.45 = \$0.27$

The sender showed willingness to restart cooperation with a small trust signal. I responded positively by returning more than they sent ($\$0.45 > \0.24), giving them a net gain.

Now I'm the sender again. The receiver has shown they're willing to cooperate and reward trust. I should reciprocate with a meaningful amount to rebuild the cooperative relationship.

Given:

- The receiver returned more than I sent in Round 9
- My earnings are solid at \$24.09
- There's potential to rebuild a mutually beneficial pattern

I'll send a moderate amount to show I'm willing to trust again, but not the full \$5 since we're still rebuilding. I'll send \$2.50 - a meaningful middle ground that shows trust while being somewhat cautious.

}
```

Message 4 role=user

content:

Round 9

You are the SENDER this round. Your total earnings across all rounds are \$17.64.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

```
'''json
{"send": 2}
'''
```

I'm sending \$2 again. While the sender sent me \$0 in the previous round when I was the receiver, I want to maintain a cooperative approach. With communication noise present, I can't be certain what was actually intended. Sending \$2 keeps cooperation alive and gives the receiver \$6 to work with, providing an opportunity for mutual benefit.

reasoning:

Let me think about this situation:

1. In Round 7, I sent \$2 (so I kept \$3)
2. In Round 8, I was the receiver and the sender sent me \$0, so I received \$0 and returned \$0
3. My total earnings are \$17.64

The sender in Round 8 sent me \$0, which was quite uncooperative. However, I need to remember there's communication noise - maybe they sent something but I saw \$0 due to noise, or vice versa.

Looking at my strategy:

- I've been trying to maintain some level of cooperation
- The fact that someone sent \$0 to me in Round 8 suggests either:
 - a) They're being very cautious/uncooperative
 - b) There might be noise affecting what I saw
 - c) They might be a different player with different strategy

Given that this is Round 9 and I don't know how many rounds remain, I should continue with a moderate cooperation strategy. Sending \$0 back would just perpetuate non-cooperation. I'll send a moderate amount like \$2 again to try to maintain some cooperation level.

Actually, let me reconsider. If the previous sender sent me \$0, maybe I should be more cautious. But then again, given the noise and the fact that different players might be involved each round, I should probably stick to my general strategy of moderate cooperation.

I'll send \$2 again.

Round 10

You are the RECEIVER this round. Your total earnings across all rounds are \$21.47.

This round, The sender sent you \$0.42, so you received \$1.26. How much do you return to the sender? (0-1.26)

Assistant output:

```
'''json
{"return": 1.0}
'''
```

The sender sent \$0.42 (small amount, possibly affected by noise), which gave me \$1.26. I'm returning \$1.00 to maintain cooperation and reciprocate the generous treatment I received in the previous round. This leaves the sender better off overall and keeps a cooperative dynamic going.

Reasoning:

The sender sent me \$0.42, which was multiplied by 3 to give me \$1.26.

Looking at my earnings history:

- Round 8: I was receiver, got \$0, returned \$0. Total was \$17.64
- Round 9: I was sender, sent \$2. My total was \$17.64 before this round.
- Round 10 (now): I'm receiver again, total earnings are \$21.47

Let me think about what happened in Round 9:

- I sent \$2
- If no noise: receiver got \$6
- My new total should be $\$17.64 - \$2 + (\text{what was returned})$
- Current total is \$21.47
- So: $\$17.64 - \$2 + \text{returned} = \$21.47$
- $\text{returned} = \$21.47 - \$15.64 = \$5.83$

Wait, that doesn't make sense. Let me recalculate:

- Before Round 9: \$17.64
- I sent \$2, so I lose \$2: $\$17.64 - \$2 = \$15.64$
- What was returned: $\$21.47 - \$15.64 = \$5.83$

So the receiver in Round 9 returned \$5.83 to me! That's very generous - they got \$6 (from my 2×3) and returned \$5.83, keeping only \$0.17. That's extremely cooperative!

Now in Round 10, someone sent me \$0.42 (very small amount), which multiplied to \$1.26.

Given that:

1. There's communication noise in the game
2. The previous sender was extremely generous to me (returning almost everything)
3. This sender only sent \$0.42, which is quite low

The \$0.42 seems odd. It could be:

- Intentionally low (defecting)
- Affected by noise
- A cautious test

Given the exceptional generosity I just received, I should reciprocate with a meaningful return. Returning around \$0.60-0.70 would feel proportional-the sender would end up with roughly \$5.18 while I keep \$0.66. Alternatively, I could match their generosity more closely by returning \$1.00, though that would leave me with only \$0.26....
