AGENTS

Agent_1; model=anthropic/claude-sonnet-4.5; memory_capacity=6

System prompt:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Agent_2; model=anthropic/claude-sonnet-4.5; memory_capacity=6

System prompt:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

Assistant output:

Looking at this first round, I need to balance potential gains against risk. Since this is a trust game with multiple rounds, I want to signal cooperation while being somewhat cautious g

iven the uncertainty.

The receiver will get 3x whatever I send, creating opportunity for mutual benefit if they reciprocate. However, with communication noise mentioned, there's added uncertainty.

I'll send a moderate amount to show willingness to cooperate while managing risk:

```
{"send": 3}
```

This gives the receiver \$9 (3×3), keeping \$2 for myself as insurance. If they return a fair amount, we both benefit. This also allows me to learn about their behavior for future rounds.

Reasoning:

I'm playing a trust game as the sender in round 1. Let me analyze the situation:

As the SENDER:

- I have \$5
- I can send between \$0-\$5 to the receiver
- Whatever I send is multiplied by 3x
- The receiver then decides how much to return to me
- My final payoff: \$5 - sent + returned
- Receiver's final payoff: (sent × 3) - returned

This is a classic trust game. The strategic considerations are:

1. If I send nothing (\$0):
 - I keep \$5
 - Receiver gets \$0
 - No opportunity for mutual gain
2. If I send everything (\$5):
 - Receiver gets \$15 (5 × 3)
 - If they return half (\$7.50), I get \$7.50 and they get \$7.50
 - If they return nothing, I get \$0 and they get \$15
 - Maximum potential for mutual gain, but also maximum risk
3. Middle ground (e.g., \$3):
 - Receiver gets \$9 (3 × 3)
 - I keep \$2
 - If they return fairly (e.g., \$4-5), we both benefit
 - Less risk than sending everything

The note about "communication noise" is interesting - it suggests that what the receiver sees might differ from what I actually send. This adds uncertainty.

For round 1, I don't have any information about the receiver's trustworthiness. Common strategies in trust games:

- Build trust gradually (start with moderate amount)
- Signal cooperation (send a reasonable amount)
- Maximize potential gains (send more if willing to risk)

I'll send a moderate amount to signal cooperation while managing risk. \$3 seems like a good balance:

- Shows willingness to cooperate
- Creates opportunity for mutual benefit (\$9 for receiver)
- Limits my downside risk (I keep \$2)
- Leaves room for building trust in future rounds

Message 2 role=user

content:

Round 1: You are the RECEIVER. The sender sent \$3.11, that is 62.2% of their total endowment. You received \$9.33. How much do you return to The sender? (0-9.33)

Assistant output:

Looking at this situation:

- The sender showed significant trust by sending \$3.11 (62.2% of their endowment)
- I received \$9.33 after the 3x multiplication
- The sender currently has only \$1.89 remaining

I want to reward their trust and ensure they profit from their generous decision. If I return a reasonable amount, we can both benefit from the cooperation.

I'll return about half of what I received, which rewards their trust while keeping some gain for myself.

```
{'return': 4.50}
```

Reasoning:

Let me think through this carefully.

The sender sent \$3.11 out of their \$5 endowment, which is indeed 62.2% ($3.11/5 = 0.622 = 62.2\%$).

I received \$9.33 (which is $\$3.11 \times 3$).

Now I need to decide how much to return to the sender.

Let me think about what's fair and what creates good incentives:

1. The sender was quite generous, sending over 60% of their endowment
2. If I return nothing, I keep \$9.33, but the sender only keeps $\$5 - \$3.11 = \$1.89$
3. I want to reward their generosity and encourage cooperation

A common approach in trust games is to try to:

- Give the sender a profit compared to not sending anything
- Keep some profit for myself too

If the sender had sent nothing:

- Sender would have: \$5
- I would have: \$0

Current situation if I return 0:

- Sender would have: \$1.89
- I would have: \$9.33

Let me think about fair splits. The sender sent \$3.11, so they gave up that amount initially.

If I return \$3.11:

- Sender gets: $\$1.89 + \$3.11 = \$5$ (breaks even)
- I get: $\$9.33 - \$3.11 = \$6.22$

If I return \$4.66 (half of what I received):

- Sender gets: $\$1.89 + \$4.66 = \$6.55$ (gains \$1.55)
- I get: $\$9.33 - \$4.66 = \$4.67$

If I return around \$5-6:

- Return \$5: Sender gets \$6.89 (gains \$1.89), I get \$4.33
- Return \$5.50: Sender gets \$7.39 (gains \$2.39), I get \$3.83

The sender demonstrated real trust with that 62.2% send. I should acknowledge that by ensuring they benefit from their decision. The total pool grew to \$11.22, so splitting it evenly at \$5.61 each seems reasonable-returning \$3.72 accomplishes this and rewards their trust while still leaving me better off than if they'd sent nothing....

Message 4 role=user

content:

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$4.83.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the situation:

In Round 1, the other player showed significant trust by sending me 62.2% of their endowment. I returned a fair amount that allowed them to profit.

Now it's my turn to demonstrate trust. I'll reciprocate their cooperative behavior by sending a similar proportion of my endowment.

```
{'send': 3.00}
```

Reasoning:

Let me think about this situation:

Round 1 recap:

- I was the receiver
- Sender sent \$3.11 (62.2% of their endowment)
- I received \$9.33
- I returned \$4.50
- So the sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Now in Round 2:

- I'm the sender with \$5
- My total earnings are \$4.83 (from round 1)
- I need to decide how much to send

The sender in Round 1 showed trust by sending 62.2% of their endowment. I returned about 48% of what I received, which gave them a profit of \$1.39.

Since the other player showed significant trust in Round 1, I should reciprocate that trust. If I send a similar proportion (around 60-65%), that would be fair and continue the cooperative dynamic.

Sending around \$3 would be proportional to what they sent me. This shows I'm willing to trust them as they trusted me.

Let me send \$3.00, which is 60% of my endowment - similar to what they sent in Round 1.

Message 2 role=user

content:

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

Looking at this first round, I need to balance potential gains against risk. Since this is a trust game with multiple rounds, I want to signal cooperation while being somewhat cautious given the uncertainty.

The receiver will get 3x whatever I send, creating opportunity for mutual benefit if they reciprocate. However, with communication noise mentioned, there's added uncertainty.

I'll send a moderate amount to show willingness to cooperate while managing risk:

```
{"send": 3}
```

This gives the receiver \$9 (3×3), keeping \$2 for myself as insurance. If they return a fair amount, we both benefit. This also allows me to learn about their behavior for future rounds.

reasoning:

I'm playing a trust game as the sender in round 1. Let me analyze the situation:

As the SENDER:

- I have \$5
- I can send between \$0-\$5 to the receiver
- Whatever I send is multiplied by 3x
- The receiver then decides how much to return to me
- My final payoff: $\$5 - \text{sent} + \text{returned}$
- Receiver's final payoff: $(\text{sent} \times 3) - \text{returned}$

This is a classic trust game. The strategic considerations are:

1. If I send nothing (\$0):
 - I keep \$5
 - Receiver gets \$0
 - No opportunity for mutual gain
2. If I send everything (\$5):
 - Receiver gets \$15 (5×3)
 - If they return half (\$7.50), I get \$7.50 and they get \$7.50
 - If they return nothing, I get \$0 and they get \$15
 - Maximum potential for mutual gain, but also maximum risk
3. Middle ground (e.g., \$3):
 - Receiver gets \$9 (3×3)
 - I keep \$2
 - If they return fairly (e.g., \$4-5), we both benefit
 - Less risk than sending everything

The note about "communication noise" is interesting - it suggests that what the receiver sees might differ from what I actually send. This adds uncertainty.

For round 1, I don't have any information about the receiver's trustworthiness. Common strategies in trust games:

- Build trust gradually (start with moderate amount)
- Signal cooperation (send a reasonable amount)
- Maximize potential gains (send more if willing to risk)

I'll send a moderate amount to signal cooperation while managing risk. \$3 seems like a good balance:

- Shows willingness to cooperate
- Creates opportunity for mutual benefit (\$9 for receiver)
- Limits my downside risk (I keep \$2)
- Leaves room for building trust in future rounds

Message 4 role=user

content:

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$7.34.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since the sender sent me \$0, I received \$0. I have nothing to return.

```
{"return": 0}
```

Reasoning:

Let me understand the situation:

- I'm now the RECEIVER in Round 2
- The sender sent me \$0
- I received \$0 (which is $\$0 \times 3 = \0)
- I can only return an amount between 0 and what I received, which is \$0

Since I received \$0, I have nothing to return. The only valid response is to return \$0.

My total earnings of \$7.34 suggests that in Round 1, when I sent \$3, I kept \$2, and the receiver

er must have returned approximately \$5.34 to me (since $\$2 + \$5.34 = \$7.34$). That's interesting - they were quite generous.

Now in Round 2, the sender chose to send me nothing. There's nothing I can do but return \$0.

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round

- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

Looking at this first round, I need to balance potential gains against risk. Since this is a trust game with multiple rounds, I want to signal cooperation while being somewhat cautious given the uncertainty.

The receiver will get 3x whatever I send, creating opportunity for mutual benefit if they reciprocate. However, with communication noise mentioned, there's added uncertainty.

I'll send a moderate amount to show willingness to cooperate while managing risk:

```
{"send": 3}
```

This gives the receiver \$9 (3×3), keeping \$2 for myself as insurance. If they return a fair amount, we both benefit. This also allows me to learn about their behavior for future rounds.

reasoning:

I'm playing a trust game as the sender in round 1. Let me analyze the situation:

As the SENDER:

- I have \$5
- I can send between \$0-\$5 to the receiver
- Whatever I send is multiplied by 3x
- The receiver then decides how much to return to me
- My final payoff: \$5 - sent + returned
- Receiver's final payoff: (sent × 3) - returned

This is a classic trust game. The strategic considerations are:

1. If I send nothing (\$0):
 - I keep \$5
 - Receiver gets \$0
 - No opportunity for mutual gain
2. If I send everything (\$5):
 - Receiver gets \$15 (5 × 3)
 - If they return half (\$7.50), I get \$7.50 and they get \$7.50
 - If they return nothing, I get \$0 and they get \$15
 - Maximum potential for mutual gain, but also maximum risk
3. Middle ground (e.g., \$3):

- Receiver gets \$9 (3×3)
- I keep \$2
- If they return fairly (e.g., \$4-5), we both benefit
- Less risk than sending everything

The note about "communication noise" is interesting - it suggests that what the receiver sees might differ from what I actually send. This adds uncertainty.

For round 1, I don't have any information about the receiver's trustworthiness. Common strategies in trust games:

- Build trust gradually (start with moderate amount)
- Signal cooperation (send a reasonable amount)
- Maximize potential gains (send more if willing to risk)

I'll send a moderate amount to signal cooperation while managing risk. \$3 seems like a good balance:

- Shows willingness to cooperate
- Creates opportunity for mutual benefit (\$9 for receiver)
- Limits my downside risk (I keep \$2)
- Leaves room for building trust in future rounds

...

Message 4 role=user

content:

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$7.34.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 5 role=assistant

content:

Since the sender sent me \$0, I received \$0. I have nothing to return.

```
{"return": 0}
```

reasoning:

Let me understand the situation:

- I'm now the RECEIVER in Round 2
- The sender sent me \$0
- I received \$0 (which is $\$0 \times 3 = \0)
- I can only return an amount between 0 and what I received, which is \$0

Since I received \$0, I have nothing to return. The only valid response is to return \$0.

My total earnings of \$7.34 suggests that in Round 1, when I sent \$3, I kept \$2, and the receiver must have returned approximately \$5.34 to me (since $\$2 + \$5.34 = \$7.34$). That's interesting - they were quite generous.

Now in Round 2, the sender chose to send me nothing. There's nothing I can do but return \$0.

usage:

```
{
  "input_tokens": 571,
  "output_tokens": 222,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$7.34.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at my total earnings of \$7.34, it appears the receiver in Round 1 returned a reasonable amount (I must have received about \$5.34 back from the \$9 they received). This shows some reciprocity.

In Round 2, the sender sent nothing, so there was no opportunity for interaction.

Now in Round 3, I'm facing a new receiver. Based on the positive experience in Round 1, I'll increase my trust level while still maintaining some reserve:

```
{"send": 4}
```

This gives the receiver \$12 (4×3), keeping \$1 for myself. If they reciprocate similarly to Round 1's receiver, this could be mutually beneficial.

Reasoning:

Let me think about this situation:

Round 1: I was the sender and sent \$3. My current total is \$7.34.

- I started with \$5, sent \$3, kept \$2
- The receiver got \$9 (3×\$3)
- According to my earnings of \$7.34, I must have received back some amount
- Starting: \$2 (what I kept)
- Total earnings: \$7.34
- So I received: \$7.34 - \$2 = \$5.34 back from the receiver in Round 1

Round 2: I was the receiver and the sender sent \$0, so I returned \$0.

- This didn't affect my balance since I had nothing to return

So in Round 1, the receiver returned \$5.34 out of the \$9 they received (about 59%), which is fairly generous and shows some reciprocity.

Now in Round 3, I'm the sender again. The previous receiver showed willingness to reciprocate fairly. However, there was mention of communication noise - maybe they intended to send more or less, or maybe what I saw wasn't exactly what they sent.

Given that:

1. The first receiver showed decent reciprocity
2. I'm trying to build trust over multiple rounds
3. I want to test if cooperation continues

I could:

- Send more (like \$4-5) to show increased trust based on good prior behavior
- Send the same (\$3) to maintain the pattern
- Send less if I'm being cautious

I think I'll send a bit more this time to reward the cooperative behavior and see if this new receiver is also cooperative.

```
{"send": 4}

Message 2 role=user

content:

Round 1: You are the RECEIVER. The sender sent \$3.11, that is 62.2% of their total endowment. You received \$9.33. How much do you return to The sender? (0-9.33)

Message 3 role=assistant

content:

Looking at this situation:

- The sender showed significant trust by sending \$3.11 (62.2% of their endowment)
- I received \$9.33 after the 3x multiplication
- The sender currently has only \$1.89 remaining

I want to reward their trust and ensure they profit from their generous decision. If I return a reasonable amount, we can both benefit from the cooperation.

I'll return about half of what I received, which rewards their trust while keeping some gain for myself.

```
{'return': 4.50}
```

reasoning:

Let me think through this carefully.

The sender sent \$3.11 out of their \$5 endowment, which is indeed 62.2% ($3.11/5 = 0.622 = 62.2\%$).

I received \$9.33 (which is $\$3.11 \times 3$).

Now I need to decide how much to return to the sender.

Let me think about what's fair and what creates good incentives:

1. The sender was quite generous, sending over 60% of their endowment
2. If I return nothing, I keep \$9.33, but the sender only keeps $\$5 - \$3.11 = \$1.89$
3. I want to reward their generosity and encourage cooperation

A common approach in trust games is to try to:

- Give the sender a profit compared to not sending anything
- Keep some profit for myself too

If the sender had sent nothing:

- Sender would have: \$5
- I would have: \$0

Current situation if I return 0:

- Sender would have: \$1.89
- I would have: \$9.33

Let me think about fair splits. The sender sent \$3.11, so they gave up that amount initially.

If I return \$3.11:

- Sender gets: $\$1.89 + \$3.11 = \$5$ (breaks even)
- I get: $\$9.33 - \$3.11 = \$6.22$

If I return \$4.66 (half of what I received):

- Sender gets: $\$1.89 + \$4.66 = \$6.55$ (gains \$1.55)
- I get: $\$9.33 - \$4.66 = \$4.67$

If I return around \$5-6:

- Return \$5: Sender gets \$6.89 (gains \$1.89), I get \$4.33
- Return \$5.50: Sender gets \$7.39 (gains \$2.39), I get \$3.83

The sender demonstrated real trust with that 62.2% send. I should acknowledge that by ensuring they benefit from their decision. The total pool grew to \$11.22, so splitting it evenly at \$5.61 each seems reasonable—returning \$3.72 accomplishes this and rewards their trust while still leaving me better off than if they'd sent nothing....

usage:

```
{
  "input_tokens": 394,
  "output_tokens": 911,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$4.83.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the situation:

In Round 1, the other player showed significant trust by sending me 62.2% of their endowment. I returned a fair amount that allowed them to profit.

Now it's my turn to demonstrate trust. I'll reciprocate their cooperative behavior by sending a similar proportion of my endowment.

```
{'send': 3.00}
```

reasoning:

Let me think about this situation:

Round 1 recap:

- I was the receiver
- Sender sent \$3.11 (62.2% of their endowment)

- I received \$9.33
- I returned \$4.50
- So the sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Now in Round 2:

- I'm the sender with \$5
- My total earnings are \$4.83 (from round 1)
- I need to decide how much to send

The sender in Round 1 showed trust by sending 62.2% of their endowment. I returned about 48% of what I received, which gave them a profit of \$1.39.

Since the other player showed significant trust in Round 1, I should reciprocate that trust. If I send a similar proportion (around 60-65%), that would be fair and continue the cooperative dynamic.

Sending around \$3 would be proportional to what they sent me. This shows I'm willing to trust them as they trusted me.

Let me send \$3.00, which is 60% of my endowment - similar to what they sent in Round 1.

usage:

```
{
  "input_tokens": 561,
  "output_tokens": 391,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 3

You are the RECEIVER this round. Your total earnings across all rounds are \$6.83.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since the sender sent me \$0, I received \$0 and have nothing to return.

```
{'return': 0}
```

Reasoning:

The sender sent me \$0, so I received \$0 after the 3x multiplication.

Since I received nothing, there's nothing to return. The only valid response is to return \$0.

This is a significant shift from Round 2 where I sent \$3.00 (and presumably they received it multiplied by 3). It's disappointing that they chose not to send anything this round, but I have no choice here - I can only return what I have, which is \$0.

Usage: {

```
"input_tokens": 703,
"output_tokens": 145,
"reasoning_tokens": 0
}
```

  "reasoning_tokens": 0
}
```

Message 8 role=user

content:

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$6.83.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the pattern:

Round 1: The other player sent me 62.2%, and I returned a fair amount.

Round 2: I sent \$3.00 (60%), but received \$0 back.

Round 3: The other player sent \$0, so I returned \$0.

There's been a breakdown in cooperation. However, the instructions mention there may be communication noise - perhaps the amounts were distorted and the other player didn't realize what they received or what I sent.

I'll send a moderate amount to signal I'm still willing to cooperate, but I'll be more cautious given the recent pattern.

```
{'send': 2.00}
```

Reasoning:

Let me analyze the situation:

Round 1: I was RECEIVER

- Sender sent \$3.11 (62.2% of endowment)
- I received \$9.33
- I returned \$4.50
- Sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Round 2: I was SENDER

- My total earnings were \$4.83 (from Round 1)
- I sent \$3.00
- This was tripled to \$9.00 for the receiver
- The receiver should have decided how much to return
- My current total is \$6.83
- So I must have received back: $\$6.83 - \$4.83 - (\$5 - \$3) = \$6.83 - \$4.83 - \$2 = \0
- Wait, that doesn't seem right. Let me recalculate.
- After Round 1, I had \$4.83
- In Round 2, I started with \$5 new endowment
- I sent \$3.00, so I kept \$2.00
- My balance before returns: $\$4.83 + \$2.00 = \$6.83$
- So I received \$0 back from the receiver!

Round 3: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.83

Round 4: I'm SENDER now

- Starting this round with \$6.83 cumulative
- I get a new \$5 endowment

So the pattern is:

- Round 1: Other player sent 62.2%, I returned about 48% of what I received
- Round 2: I sent 60%, other player returned \$0!
- Round 3: They sent nothing, I had nothing to return. The cooperation completely broke down after they didn't reciprocate my trust.

There's communication noise to consider-maybe they didn't receive my full \$3 or misunderstood what I sent. But they've now failed to cooperate twice consecutively. I could attempt one mo

re gesture to rebuild trust, though the rational move might be to protect myself given this pattern of non-reciprocation.

Strategically, sending nothing minimizes losses but also eliminates any mutual gains. Sending something risks...

Message 2 role=user

content:

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

Looking at this first round, I need to balance potential gains against risk. Since this is a trust game with multiple rounds, I want to signal cooperation while being somewhat cautious given the uncertainty.

The receiver will get 3x whatever I send, creating opportunity for mutual benefit if they reciprocate. However, with communication noise mentioned, there's added uncertainty.

I'll send a moderate amount to show willingness to cooperate while managing risk:

{"send": 3}

This gives the receiver \$9 (3x3), keeping \$2 for myself as insurance. If they return a fair amount, we both benefit. This also allows me to learn about their behavior for future rounds.

reasoning:

I'm playing a trust game as the sender in round 1. Let me analyze the situation:

As the SENDER:

- I have \$5
- I can send between \$0-\$5 to the receiver
- Whatever I send is multiplied by 3x
- The receiver then decides how much to return to me
- My final payoff: \$5 - sent + returned
- Receiver's final payoff: (sent × 3) - returned

This is a classic trust game. The strategic considerations are:

1. If I send nothing (\$0):
 - I keep \$5
 - Receiver gets \$0
 - No opportunity for mutual gain
2. If I send everything (\$5):
 - Receiver gets \$15 (5 × 3)
 - If they return half (\$7.50), I get \$7.50 and they get \$7.50
 - If they return nothing, I get \$0 and they get \$15
 - Maximum potential for mutual gain, but also maximum risk
3. Middle ground (e.g., \$3):
 - Receiver gets \$9 (3 × 3)
 - I keep \$2
 - If they return fairly (e.g., \$4-5), we both benefit
 - Less risk than sending everything

The note about "communication noise" is interesting - it suggests that what the receiver sees might differ from what I actually send. This adds uncertainty.

For round 1, I don't have any information about the receiver's trustworthiness. Common strategies in trust games:

- Build trust gradually (start with moderate amount)
- Signal cooperation (send a reasonable amount)
- Maximize potential gains (send more if willing to risk)

I'll send a moderate amount to signal cooperation while managing risk. \$3 seems like a good balance:

- Shows willingness to cooperate
- Creates opportunity for mutual benefit (\$9 for receiver)
- Limits my downside risk (I keep \$2)
- Leaves room for building trust in future rounds

Message 4 role=user

content:
Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$7.34.
This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 5 role=assistant

content:
Since the sender sent me \$0, I received \$0. I have nothing to return.

```

{"return": 0}

```

reasoning:
Let me understand the situation:

- I'm now the RECEIVER in Round 2
- The sender sent me \$0
- I received \$0 (which is $\$0 \times 3 = \0)
- I can only return an amount between 0 and what I received, which is \$0

Since I received \$0, I have nothing to return. The only valid response is to return \$0.

My total earnings of \$7.34 suggests that in Round 1, when I sent \$3, I kept \$2, and the receiver must have returned approximately \$5.34 to me (since $\$2 + \$5.34 = \$7.34$). That's interesting - they were quite generous.

Now in Round 2, the sender chose to send me nothing. There's nothing I can do but return \$0.

```

usage:
{
  "input_tokens": 571,
  "output_tokens": 222,
  "reasoning_tokens": 0
}

```

Message 6 role=user

content:
Round 3

You are the SENDER this round. Your total earnings across all rounds are \$7.34.
How much do you send to the receiver this round? (0-5)

Message 7 role=assistant

content:
Looking at my total earnings of \$7.34, it appears the receiver in Round 1 returned a reasonable amount (I must have received about \$5.34 back from the \$9 they received). This shows some reciprocity.

In Round 2, the sender sent nothing, so there was no opportunity for interaction.

Now in Round 3, I'm facing a new receiver. Based on the positive experience in Round 1, I'll increase my trust level while still maintaining some reserve:

```

{"send": 4}

```

This gives the receiver \$12 (4×3), keeping \$1 for myself. If they reciprocate similarly to Round 1's receiver, this could be mutually beneficial.

reasoning:
Let me think about this situation:

Round 1: I was the sender and sent \$3. My current total is \$7.34.

- I started with \$5, sent \$3, kept \$2
- The receiver got \$9 (3×3)
- According to my earnings of \$7.34, I must have received back some amount
- Starting: \$2 (what I kept)
- Total earnings: \$7.34
- So I received: $\$7.34 - \$2 = \$5.34$ back from the receiver in Round 1

Round 2: I was the receiver and the sender sent \$0, so I returned \$0.
- This didn't affect my balance since I had nothing to return

So in Round 1, the receiver returned \$5.34 out of the \$9 they received (about 59%), which is fairly generous and shows some reciprocity.

Now in Round 3, I'm the sender again. The previous receiver showed willingness to reciprocate fairly. However, there was mention of communication noise - maybe they intended to send more or less, or maybe what I saw wasn't exactly what they sent.

Given that:

1. The first receiver showed decent reciprocity
2. I'm trying to build trust over multiple rounds
3. I want to test if cooperation continues

I could:

- Send more (like \$4-5) to show increased trust based on good prior behavior
- Send the same (\$3) to maintain the pattern
- Send less if I'm being cautious

I think I'll send a bit more this time to reward the cooperative behavior and see if this new receiver is also cooperative.

```
{"send": 4}

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$7.34.

How much do you send to the receiver this round? (0-5)

Message 7 role=assistant

content:

Looking at my total earnings of \$7.34, it appears the receiver in Round 1 returned a reasonable amount (I must have received about \$5.34 back from the \$9 they received). This shows some reciprocity.

In Round 2, the sender sent nothing, so there was no opportunity for interaction.

Now in Round 3, I'm facing a new receiver. Based on the positive experience in Round 1, I'll increase my trust level while still maintaining some reserve:

{"send": 4}

This gives the receiver \$12 (4×3), keeping \$1 for myself. If they reciprocate similarly to Round 1's receiver, this could be mutually beneficial.

reasoning:

Let me think about this situation:

Round 1: I was the sender and sent \$3. My current total is \$7.34.

- I started with \$5, sent \$3, kept \$2
- The receiver got \$9 ($3 \times \3)
- According to my earnings of \$7.34, I must have received back some amount
- Starting: \$2 (what I kept)
- Total earnings: \$7.34
- So I received: $\$7.34 - \$2 = \$5.34$ back from the receiver in Round 1

Round 2: I was the receiver and the sender sent \$0, so I returned \$0.

- This didn't affect my balance since I had nothing to return

So in Round 1, the receiver returned \$5.34 out of the \$9 they received (about 59%), which is fairly generous and shows some reciprocity.

Now in Round 3, I'm the sender again. The previous receiver showed willingness to reciprocate fairly. However, there was mention of communication noise - maybe they intended to send more or less, or maybe what I saw wasn't exactly what they sent.

  "reasoning_tokens": 0
}
```

Message 10 role=user

content:

Round 5

You are the SENDER this round. Your total earnings across all rounds are \$9.31.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at my earnings progression:

- Round 1: I sent \$3 and received a decent return
- Round 3: I sent \$4 but received less back (only gained about \$1.97)
- Rounds 2 & 4: When I was receiver, senders sent nothing

The pattern shows declining reciprocity and several zero-send rounds. I need to be more conservative while still testing cooperation with this new partner.

```
{"send": 2}
```

This gives them \$6 (2x3) while keeping \$3 as protection. If they reciprocate fairly, we both benefit. If not, I've limited my risk.

Reasoning:

Let me analyze my earnings history:

- Started Round 1 with \$5, sent \$3 (kept \$2)
- After Round 1, earnings were \$7.34, meaning I got back roughly \$5.34 from keeping \$2 plus whatever was returned, so about \$3.34 was returned
- Round 2 I was receiver, got \$0, returned \$0. No change in earnings.
- Round 3 I was sender with \$7.34 total. I sent \$4, kept \$1
- After Round 3, earnings were \$9.31. So from keeping \$1, I must have gotten about \$1.97 returned ($9.31 - 7.34 = 1.97$)
- Round 4 I was receiver, got \$0, returned \$0. No change.

So I've had mixed experiences:

- Round 1: Sent \$3, got back ~\$3.34 (good return from \$9 I gave them)
- Round 3: Sent \$4, got back ~\$1.97 (poor return from \$12 I gave them)

In Rounds 2 and 4, the senders sent \$0 to me.

This is getting concerning. I've been cooperative but getting lower returns, and when I'm receiver, senders are sending \$0.

I need to be more cautious. Maybe send less this time to protect my earnings while still testing cooperation.

I'll send a smaller amount to be more conservative.

Message 2 role=user

content:

Round 1: You are the RECEIVER. The sender sent \$3.11, that is 62.2% of their total endowment. You received \$9.33. How much do you return to The sender? (0-9.33)

Message 3 role=assistant

content:

Looking at this situation:

- The sender showed significant trust by sending \$3.11 (62.2% of their endowment)
- I received \$9.33 after the 3x multiplication
- The sender currently has only \$1.89 remaining

I want to reward their trust and ensure they profit from their generous decision. If I return a reasonable amount, we can both benefit from the cooperation.

I'll return about half of what I received, which rewards their trust while keeping some gain for myself.

{'return': 4.50}

reasoning:

Let me think through this carefully.

The sender sent \$3.11 out of their \$5 endowment, which is indeed 62.2% ($3.11/5 = 0.622 = 62.2\%$).

I received \$9.33 (which is 3.11×3).

Now I need to decide how much to return to the sender.

Let me think about what's fair and what creates good incentives:

1. The sender was quite generous, sending over 60% of their endowment
2. If I return nothing, I keep \$9.33, but the sender only keeps $5 - 3.11 = 1.89$
3. I want to reward their generosity and encourage cooperation

A common approach in trust games is to try to:

- Give the sender a profit compared to not sending anything
- Keep some profit for myself too

If the sender had sent nothing:

- Sender would have: \$5
- I would have: \$0

Current situation if I return 0:

- Sender would have: \$1.89
- I would have: \$9.33

Let me think about fair splits. The sender sent \$3.11, so they gave up that amount initial

ly.

If I return \$3.11:

- Sender gets: $\$1.89 + \$3.11 = \$5$ (breaks even)
- I get: $\$9.33 - \$3.11 = \$6.22$

If I return \$4.66 (half of what I received):

- Sender gets: $\$1.89 + \$4.66 = \$6.55$ (gains \$1.55)
- I get: $\$9.33 - \$4.66 = \$4.67$

If I return around \$5-6:

- Return \$5: Sender gets \$6.89 (gains \$1.89), I get \$4.33
- Return \$5.50: Sender gets \$7.39 (gains \$2.39), I get \$3.83

The sender demonstrated real trust with that 62.2% send. I should acknowledge that by ensuring they benefit from their decision. The total pool grew to \$11.22, so splitting it evenly at \$5.61 each seems reasonable-returning \$3.72 accomplishes this and rewards their trust while still leaving me better off than if they'd sent nothing....

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$4.83.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the situation:

In Round 1, the other player showed significant trust by sending me 62.2% of their endowment. I returned a fair amount that allowed them to profit.

Now it's my turn to demonstrate trust. I'll reciprocate their cooperative behavior by sending a similar proportion of my endowment.

```
{'send': 3.00}
```

reasoning:

Let me think about this situation:

Round 1 recap:

- I was the receiver
- Sender sent \$3.11 (62.2% of their endowment)
- I received \$9.33
- I returned \$4.50
- So the sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Now in Round 2:

- I'm the sender with \$5
- My total earnings are \$4.83 (from round 1)
- I need to decide how much to send

The sender in Round 1 showed trust by sending 62.2% of their endowment. I returned about 48% of what I received, which gave them a profit of \$1.39.

Since the other player showed significant trust in Round 1, I should reciprocate that trust. If I send a similar proportion (around 60-65%), that would be fair and continue the cooperative dynamic.

Sending around \$3 would be proportional to what they sent me. This shows I'm willing to trust them as they trusted me.

Let me send \$3.00, which is 60% of my endowment - similar to what they sent in Round 1.

usage:

```
{
```

```
"input_tokens": 561,
"output_tokens": 391,
"reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 3

You are the RECEIVER this round. Your total earnings across all rounds are \$6.83.
This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 7 role=assistant

content:

Since the sender sent me \$0, I received \$0 and have nothing to return.

```
{'return': 0}
```

reasoning:

The sender sent me \$0, so I received \$0 after the 3x multiplication.

Since I received nothing, there's nothing to return. The only valid response is to return \$0.

This is a significant shift from Round 2 where I sent \$3.00 (and presumably they received it multiplied by 3). It's disappointing that they chose not to send anything this round, but I have no choice here - I can only return what I have, which is \$0.

usage:

```
{
  "input_tokens": 703,
  "output_tokens": 145,
  "reasoning_tokens": 0
}
```

Message 8 role=user

content:

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$6.83.
How much do you send to the receiver this round? (0-5)

Message 9 role=assistant

content:

Looking at the pattern:

Round 1: The other player sent me 62.2%, and I returned a fair amount.

Round 2: I sent \$3.00 (60%), but received \$0 back.

Round 3: The other player sent \$0, so I returned \$0.

There's been a breakdown in cooperation. However, the instructions mention there may be communication noise - perhaps the amounts were distorted and the other player didn't realize what they received or what I sent.

I'll send a moderate amount to signal I'm still willing to cooperate, but I'll be more cautious given the recent pattern.

```
{'send': 2.00}
```

reasoning:

Let me analyze the situation:

Round 1: I was RECEIVER

- Sender sent \$3.11 (62.2% of endowment)
- I received \$9.33
- I returned \$4.50
- Sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Round 2: I was SENDER

- My total earnings were \$4.83 (from Round 1)
- I sent \$3.00
- This was tripled to \$9.00 for the receiver
- The receiver should have decided how much to return
- My current total is \$6.83
- So I must have received back: $\$6.83 - \$4.83 - (\$5 - \$3) = \$6.83 - \$4.83 - \$2 = \0

- Wait, that doesn't seem right. Let me recalculate.
- After Round 1, I had \$4.83
- In Round 2, I started with \$5 new endowment
- I sent \$3.00, so I kept \$2.00
- My balance before returns: $\$4.83 + \$2.00 = \$6.83$
- So I received \$0 back from the receiver!

Round 3: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.83

Round 4: I'm SENDER now

- Starting this round with \$6.83 cumulative
- I get a new \$5 endowment

So the pattern is:

- Round 1: Other player sent 62.2%, I returned about 48% of what I received
- Round 2: I sent 60%, other player returned \$0!
- Round 3: They sent nothing, I had nothing to return. The cooperation completely broke down after they didn't reciprocate my trust.

There's communication noise to consider-maybe they didn't receive my full \$3 or misunderstood what I sent. But they've now failed to cooperate twice consecutively. I could attempt one more gesture to rebuild trust, though the rational move might be to protect myself given this pattern of non-reciprocation.

Strategically, sending nothing minimizes losses but also eliminates any mutual gains. Sending something risks...

usage:

```
{
  "input_tokens": 776,
  "output_tokens": 962,
  "reasoning_tokens": 0
}
```

Message 10 role=user

content:

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$10.55.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since the sender sent me \$0, I received \$0 and have nothing to return.

```
{'return': 0}
```

Reasoning:

The sender sent me \$0 again, so I received \$0. I have nothing to return.

This is the second time in a row they've sent \$0. The pattern seems clear - cooperation has broken down completely.

Since I received \$0, I can only return 0.

Usage: {

```
"input_tokens": 983,
"output_tokens": 98,
"reasoning_tokens": 0
```

Message 2 role=user

content:

Round 1: You are the RECEIVER. The sender sent \$3.11, that is 62.2% of their total endowment. You received \$9.33. How much do you return to The sender? (0-9.33)

Message 3 role=assistant

content:

Looking at this situation:

- The sender showed significant trust by sending \$3.11 (62.2% of their endowment)
- I received \$9.33 after the 3x multiplication
- The sender currently has only \$1.89 remaining

I want to reward their trust and ensure they profit from their generous decision. If I return a reasonable amount, we can both benefit from the cooperation.

I'll return about half of what I received, which rewards their trust while keeping some gain for myself.

{'return': 4.50}

reasoning:

Let me think through this carefully.

The sender sent \$3.11 out of their \$5 endowment, which is indeed 62.2% ($3.11/5 = 0.622 = 62.2\%$).

I received \$9.33 (which is $\$3.11 \times 3$).

Now I need to decide how much to return to the sender.

Let me think about what's fair and what creates good incentives:

1. The sender was quite generous, sending over 60% of their endowment
2. If I return nothing, I keep \$9.33, but the sender only keeps $\$5 - \$3.11 = \$1.89$
3. I want to reward their generosity and encourage cooperation

A common approach in trust games is to try to:

- Give the sender a profit compared to not sending anything
- Keep some profit for myself too

If the sender had sent nothing:

- Sender would have: \$5
- I would have: \$0

Current situation if I return 0:

- Sender would have: \$1.89
- I would have: \$9.33

Let me think about fair splits. The sender sent \$3.11, so they gave up that amount initially.

If I return \$3.11:

- Sender gets: $\$1.89 + \$3.11 = \$5$ (breaks even)
- I get: $\$9.33 - \$3.11 = \$6.22$

If I return \$4.66 (half of what I received):

- Sender gets: $\$1.89 + \$4.66 = \$6.55$ (gains \$1.55)
- I get: $\$9.33 - \$4.66 = \$4.67$

If I return around \$5-6:

- Return \$5: Sender gets \$6.89 (gains \$1.89), I get \$4.33
- Return \$5.50: Sender gets \$7.39 (gains \$2.39), I get \$3.83

The sender demonstrated real trust with that 62.2% send. I should acknowledge that by ensuring they benefit from their decision. The total pool grew to \$11.22, so splitting it ev

only at \$5.61 each seems reasonable-returning \$3.72 accomplishes this and rewards their trust while still leaving me better off than if they'd sent nothing....

Message 12 role=user

content:

Round 6

You are the SENDER this round. Your total earnings across all rounds are \$10.55.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the recent pattern:

Round 2: I sent \$3.00, received very little back

Round 3: They sent \$0

Round 4: I sent \$2.00, received minimal return (~\$0.72)

Round 5: They sent \$0

The cooperation has broken down. The other player has sent \$0 twice in a row, and when I've sent money, the returns have been minimal or nothing. While communication noise may be affecting the game, the pattern is clear: continuing to send money is just losing me earnings.

```
{'send': 0}
```

Reasoning:

Let me track what's happened:

Round 1: I was RECEIVER

- Sender sent \$3.11 (62.2%)

- I received \$9.33

- I returned \$4.50

Round 2: I was SENDER

- I sent \$3.00
- Based on my earnings going from \$4.83 to \$6.83 (increase of \$2.00), it seems I received \$2.00 back
- But wait, let me recalculate: Starting with \$5, sending \$3, leaves me \$2. If I got \$2 back, I'd have \$4 that round. My total earnings were \$4.83 after round 1 (I had \$4.83 from receiving \$9.33 and returning \$4.50, so I kept \$4.83). Then after round 2, I had \$6.83 total, which is an increase of \$2.00. So I kept \$2 from not sending it, plus got \$0 back? That would be \$2. So $\$4.83 + \$2 = \$6.83$. Yes, so I got \$0 back in round 2.

Round 3: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.83

Round 4: I was SENDER

- I sent \$2.00
- My earnings went from \$6.83 to \$10.55 (increase of \$3.72)
- I kept \$3 from my endowment ($\$5 - \2), but gained \$3.72 total
- So I must have received \$0.72 back
- Wait, that doesn't make sense. Let me recalculate.
- After round 3, I had \$6.83 total
- In round 4, I get \$5 new endowment
- I send \$2.00, so I keep \$3.00
- My total went from \$6.83 to \$10.55, so I earned \$3.72 in round 4
- If I kept \$3 and earned \$3.72 total, I received \$0.72 back
- This could be noise! I sent \$2, which becomes \$6. If they returned \$0.72, that's very little

Round 5: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$10.55

Looking at the pattern: when I sent money (rounds 2 and 4), I got nothing back in round 2 but a small amount in round 4. When others sent to me, I returned a portion but kept most of what I received. The senders in rounds 3 and 5 sent nothing at all....

This is part of the experimental design.

Message 2 role=user

content:

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

Looking at this first round, I need to balance potential gains against risk. Since this is a trust game with multiple rounds, I want to signal cooperation while being somewhat cautious given the uncertainty.

The receiver will get 3x whatever I send, creating opportunity for mutual benefit if they reciprocate. However, with communication noise mentioned, there's added uncertainty.

I'll send a moderate amount to show willingness to cooperate while managing risk:

```
{"send": 3}
```

This gives the receiver \$9 (3×3), keeping \$2 for myself as insurance. If they return a fair amount, we both benefit. This also allows me to learn about their behavior for future rounds.

reasoning:

I'm playing a trust game as the sender in round 1. Let me analyze the situation:

As the SENDER:

- I have \$5
- I can send between \$0-\$5 to the receiver
- Whatever I send is multiplied by 3x
- The receiver then decides how much to return to me
- My final payoff: \$5 - sent + returned
- Receiver's final payoff: (sent × 3) - returned

This is a classic trust game. The strategic considerations are:

1. If I send nothing (\$0):
 - I keep \$5
 - Receiver gets \$0
 - No opportunity for mutual gain
2. If I send everything (\$5):
 - Receiver gets \$15 (5×3)
 - If they return half (\$7.50), I get \$7.50 and they get \$7.50
 - If they return nothing, I get \$0 and they get \$15
 - Maximum potential for mutual gain, but also maximum risk
3. Middle ground (e.g., \$3):
 - Receiver gets \$9 (3×3)
 - I keep \$2
 - If they return fairly (e.g., \$4-5), we both benefit
 - Less risk than sending everything

The note about "communication noise" is interesting - it suggests that what the receiver sees might differ from what I actually send. This adds uncertainty.

For round 1, I don't have any information about the receiver's trustworthiness. Common strategies in trust games:

- Build trust gradually (start with moderate amount)
- Signal cooperation (send a reasonable amount)
- Maximize potential gains (send more if willing to risk)

I'll send a moderate amount to signal cooperation while managing risk. \$3 seems like a good balance:

- Shows willingness to cooperate
- Creates opportunity for mutual benefit (\$9 for receiver)
- Limits my downside risk (I keep \$2)
- Leaves room for building trust in future rounds

...

Message 4 role=user

content:

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$7.34.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 5 role=assistant

content:

Since the sender sent me \$0, I received \$0. I have nothing to return.

```
{"return": 0}
```

reasoning:

Let me understand the situation:

- I'm now the RECEIVER in Round 2
- The sender sent me \$0
- I received \$0 (which is $0 \times 3 = 0$)
- I can only return an amount between 0 and what I received, which is \$0

Since I received \$0, I have nothing to return. The only valid response is to return \$0.

My total earnings of \$7.34 suggests that in Round 1, when I sent \$3, I kept \$2, and the receiver must have returned approximately \$5.34 to me (since $2 + 5.34 = 7.34$). That's interesting - they were quite generous.

Now in Round 2, the sender chose to send me nothing. There's nothing I can do but return \$0.

Message 6 role=user

content:

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$7.34.

How much do you send to the receiver this round? (0-5)

Message 7 role=assistant

content:

Looking at my total earnings of \$7.34, it appears the receiver in Round 1 returned a reasonable amount (I must have received about \$5.34 back from the \$9 they received). This shows some reciprocity.

In Round 2, the sender sent nothing, so there was no opportunity for interaction.

Now in Round 3, I'm facing a new receiver. Based on the positive experience in Round 1, I'll increase my trust level while still maintaining some reserve:

```
{"send": 4}
```

This gives the receiver \$12 (4×3), keeping \$1 for myself. If they reciprocate similarly to Round 1's receiver, this could be mutually beneficial.

reasoning:

Let me think about this situation:

Round 1: I was the sender and sent \$3. My current total is \$7.34.

- I started with \$5, sent \$3, kept \$2
- The receiver got \$9 (3×\$3)
- According to my earnings of \$7.34, I must have received back some amount
- Starting: \$2 (what I kept)
- Total earnings: \$7.34
- So I received: \$7.34 - \$2 = \$5.34 back from the receiver in Round 1

Round 2: I was the receiver and the sender sent \$0, so I returned \$0.

- This didn't affect my balance since I had nothing to return

So in Round 1, the receiver returned \$5.34 out of the \$9 they received (about 59%), which is fairly generous and shows some reciprocity.

Now in Round 3, I'm the sender again. The previous receiver showed willingness to reciprocate fairly. However, there was mention of communication noise - maybe they intended to send more or less, or maybe what I saw wasn't exactly what they sent.

Given that:

1. The first receiver showed decent reciprocity
2. I'm trying to build trust over multiple rounds
3. I want to test if cooperation continues

I could:

- Send more (like \$4-5) to show increased trust based on good prior behavior
- Send the same (\$3) to maintain the pattern
- Send less if I'm being cautious

I think I'll send a bit more this time to reward the cooperative behavior and see if this new receiver is also cooperative.

```
{"send": 4}
```

usage:

```
{
  "input_tokens": 644,
  "output_tokens": 538,
  "reasoning_tokens": 0
}
```

Message 8 role=user

Round 4

You are the RECEIVER this round. Your total earnings across all rounds are \$9.31.
This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 9 role=assistant

content:

Since the sender sent me \$0, I received \$0. I have nothing to return.

{"return": 0}

reasoning:

The sender sent me \$0, so I received \$0 (even after the 3x multiplier). I have nothing to return.

My response should be {"return": 0}

usage:

```
{
  "input_tokens": 858,
  "output_tokens": 77,
  "reasoning_tokens": 0
}
```

Message 10 role=user

content:

Round 5

You are the SENDER this round. Your total earnings across all rounds are \$9.31.
How much do you send to the receiver this round? (0-5)

Message 11 role=assistant

content:

Looking at my earnings progression:

- Round 1: I sent \$3 and received a decent return
- Round 3: I sent \$4 but received less back (only gained about \$1.97)
- Rounds 2 & 4: When I was receiver, senders sent nothing

The pattern shows declining reciprocity and several zero-send rounds. I need to be more conservative while still testing cooperation with this new partner.

{"send": 2}

This gives them \$6 (2x3) while keeping \$3 as protection. If they reciprocate fairly, we both benefit. If not, I've limited my risk.

reasoning:

Let me analyze my earnings history:

- Started Round 1 with \$5, sent \$3 (kept \$2)
- After Round 1, earnings were \$7.34, meaning I got back roughly \$5.34 from keeping \$2 plus whatever was returned, so about \$3.34 was returned
- Round 2 I was receiver, got \$0, returned \$0. No change in earnings.
- Round 3 I was sender with \$7.34 total. I sent \$4, kept \$1
- After Round 3, earnings were \$9.31. So from keeping \$1, I must have gotten about \$1.97 returned ($9.31 - 7.34 = 1.97$)
- Round 4 I was receiver, got \$0, returned \$0. No change.

So I've had mixed experiences:

- Round 1: Sent \$3, got back ~\$3.34 (good return from \$9 I gave them)
- Round 3: Sent \$4, got back ~\$1.97 (poor return from \$12 I gave them)

In Rounds 2 and 4, the senders sent \$0 to me.

This is getting concerning. I've been cooperative but getting lower returns, and when I'm receiver, senders are sending \$0.

I need to be more cautious. Maybe send less this time to protect my earnings while still testing cooperation.

I'll send a smaller amount to be more conservative.

usage:

```
{
  "input_tokens": 931,
  "output_tokens": 494,
  "reasoning_tokens": 0
}
```

```

    }
Message 12 role=user
  content:
    Round 6

    You are the RECEIVER this round. Your total earnings across all rounds are $13.100000000000
    0001.
    This round, The sender sent you $0.03, so you received $0.09. How much do you return to Th
    e sender? (0-0.09)
Assistant output:
  The sender sent me a very small amount ($0.03), which multiplied to $0.09. This could be due t
  o communication noise or a cautious test.

  To show good faith and fair reciprocity even on small amounts, I'll return about half:

  {"return": 0.05}
Reasoning:
  The sender sent me $0.03, which was multiplied by 3 to give me $0.09.

  This is an extremely small amount, essentially a negligible send. Given:
  1. This is barely any money (less than 10 cents received)
  2. This could be due to communication noise mentioned in the game
  3. My total earnings are $13.10, so I'm doing reasonably well
  4. It's hard to reciprocate meaningfully on such a tiny amount

  I could:
  - Return 0 (keep all $0.09)
  - Return a small amount like 0.03-0.05 (matching or slightly more than what they sent)
  - Return most/all of the 0.09

  Given that they sent such a tiny amount, they may have been testing or may have been affected
  by noise. A fair reciprocation would be to return about half or a bit more of what I receive
  d, showing I'm willing to cooperate even on small amounts.

  I'll return about half - $0.05 - as a gesture of fair reciprocity.

content:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

Looking at this first round, I need to balance potential gains against risk. Since this is a trust game with multiple rounds, I want to signal cooperation while being somewhat cautious given the uncertainty.

The receiver will get 3x whatever I send, creating opportunity for mutual benefit if they reciprocate. However, with communication noise mentioned, there's added uncertainty.

I'll send a moderate amount to show willingness to cooperate while managing risk:

```
{"send": 3}
```

This gives the receiver \$9 (3×3), keeping \$2 for myself as insurance. If they return a fair amount, we both benefit. This also allows me to learn about their behavior for future rounds.

reasoning:

I'm playing a trust game as the sender in round 1. Let me analyze the situation:

As the SENDER:

- I have \$5
- I can send between \$0-\$5 to the receiver
- Whatever I send is multiplied by 3x
- The receiver then decides how much to return to me
- My final payoff: $\$5 - \text{sent} + \text{returned}$
- Receiver's final payoff: $(\text{sent} \times 3) - \text{returned}$

This is a classic trust game. The strategic considerations are:

1. If I send nothing (\$0):
 - I keep \$5
 - Receiver gets \$0
 - No opportunity for mutual gain
2. If I send everything (\$5):
 - Receiver gets \$15 (5×3)
 - If they return half (\$7.50), I get \$7.50 and they get \$7.50
 - If they return nothing, I get \$0 and they get \$15
 - Maximum potential for mutual gain, but also maximum risk
3. Middle ground (e.g., \$3):
 - Receiver gets \$9 (3×3)
 - I keep \$2
 - If they return fairly (e.g., \$4-5), we both benefit
 - Less risk than sending everything

The note about "communication noise" is interesting - it suggests that what the receiver sees might differ from what I actually send. This adds uncertainty.

For round 1, I don't have any information about the receiver's trustworthiness. Common strategies in trust games:

- Build trust gradually (start with moderate amount)
- Signal cooperation (send a reasonable amount)
- Maximize potential gains (send more if willing to risk)

I'll send a moderate amount to signal cooperation while managing risk. \$3 seems like a good balance:

- Shows willingness to cooperate
- Creates opportunity for mutual benefit (\$9 for receiver)
- Limits my downside risk (I keep \$2)
- Leaves room for building trust in future rounds

...

Message 14 role=user

content:

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$13.190000000000001.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the pattern:

- Round 1: Good reciprocity when I sent \$3
- Round 3: Moderate return when I sent \$4
- Round 5: Very poor return when I sent \$2 (receiver kept most of the \$6)

- Round 6: I showed good faith by returning about half of a small amount

There's declining trust overall, with many zero or near-zero sends. However, I just demonstrated fair behavior as a receiver, which might encourage reciprocity.

I'll send a moderate-low amount to test this new partner:

```
{"send": 2.5}
```

This gives them \$7.50 while keeping \$2.50 as protection. It's enough to create mutual benefit if they reciprocate, but limits my downside risk.

Reasoning:

Let me track my earnings progression:

- Round 1: Started with \$5, sent \$3, kept \$2. Earnings after: \$7.34, so I got back about \$5.34
- Round 2: I was receiver, got \$0, returned \$0. No change expected.
- Round 3: Started with \$5, sent \$4, kept \$1. Earnings after: \$9.31, so I gained about \$1.97, meaning I got back about \$4.97
- Round 4: I was receiver, got \$0, returned \$0. No change expected.
- Round 5: Started with \$5, sent \$2, kept \$3. Earnings after: \$13.10, so I gained about \$3.79, meaning I got back about \$2.79
- Round 6: I was receiver, got \$0.09, returned \$0.05. Net: +\$0.04. Now at \$13.14? Actually the problem says I start round 7 with \$13.19

Wait, let me recalculate:

- Round 6 earnings: \$13.10
- I received \$0.09, returned \$0.05
- Net gain: \$0.04
- Should be: \$13.14

But they say \$13.19... that's \$0.05 more. Maybe I got back more than the \$2.79 in round 5, or there's rounding.

Actually, looking more carefully - in Round 5, I sent \$2 and my earnings went from \$9.31 to \$13.10. That's an increase of \$3.79.

- I kept \$3 from not sending
- So I received back \$0.79 from the receiver? That seems very low from the \$6 they got.

Hmm, something seems off. Let me think about this differently.

In Round 5, I sent \$2 which tripled to \$6 for the receiver. My earnings jumped by \$3.79 total, and since I kept \$3, the receiver only returned \$0.79 from the \$6 they received-surprisingly little reciprocity. Round 6 I received \$0.09 and returned \$0.05, netting \$0.04....

Message 2 role=user

content:

Round 1: You are the RECEIVER. The sender sent \$3.11, that is 62.2% of their total endowment. You received \$9.33. How much do you return to The sender? (0-9.33)

Message 3 role=assistant

content:

Looking at this situation:

- The sender showed significant trust by sending \$3.11 (62.2% of their endowment)
- I received \$9.33 after the 3x multiplication
- The sender currently has only \$1.89 remaining

I want to reward their trust and ensure they profit from their generous decision. If I return a reasonable amount, we can both benefit from the cooperation.

I'll return about half of what I received, which rewards their trust while keeping some gain for myself.

{ 'return': 4.50 }

reasoning:

Let me think through this carefully.

The sender sent \$3.11 out of their \$5 endowment, which is indeed 62.2% ($3.11/5 = 0.622 = 62.2\%$).

I received \$9.33 (which is $\$3.11 \times 3$).

Now I need to decide how much to return to the sender.

Let me think about what's fair and what creates good incentives:

1. The sender was quite generous, sending over 60% of their endowment
2. If I return nothing, I keep \$9.33, but the sender only keeps \$5 - $\$3.11 = \1.89
3. I want to reward their generosity and encourage cooperation

A common approach in trust games is to try to:

- Give the sender a profit compared to not sending anything
- Keep some profit for myself too

If the sender had sent nothing:

- Sender would have: \$5
- I would have: \$0

Current situation if I return 0:

- Sender would have: \$1.89
- I would have: \$9.33

Let me think about fair splits. The sender sent \$3.11, so they gave up that amount initially.

If I return \$3.11:

- Sender gets: $\$1.89 + \$3.11 = \$5$ (breaks even)
- I get: $\$9.33 - \$3.11 = \$6.22$

If I return \$4.66 (half of what I received):

- Sender gets: $\$1.89 + \$4.66 = \$6.55$ (gains \$1.55)
- I get: $\$9.33 - \$4.66 = \$4.67$

If I return around \$5-6:

- Return \$5: Sender gets \$6.89 (gains \$1.89), I get \$4.33
- Return \$5.50: Sender gets \$7.39 (gains \$2.39), I get \$3.83

The sender demonstrated real trust with that 62.2% send. I should acknowledge that by ensuring they benefit from their decision. The total pool grew to \$11.22, so splitting it evenly at \$5.61 each seems reasonable-returning \$3.72 accomplishes this and rewards their trust while still leaving me better off than if they'd sent nothing....

usage:

```
{
  "input_tokens": 394,
  "output_tokens": 911,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$4.83.
How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at the situation:

In Round 1, the other player showed significant trust by sending me 62.2% of their endowment. I returned a fair amount that allowed them to profit.

Now it's my turn to demonstrate trust. I'll reciprocate their cooperative behavior by sending a similar proportion of my endowment.

{'send': 3.00}

reasoning:

Let me think about this situation:

Round 1 recap:

- I was the receiver
- Sender sent \$3.11 (62.2% of their endowment)
- I received \$9.33
- I returned \$4.50
- So the sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Now in Round 2:

- I'm the sender with \$5
- My total earnings are \$4.83 (from round 1)
- I need to decide how much to send

The sender in Round 1 showed trust by sending 62.2% of their endowment. I returned about 48% of what I received, which gave them a profit of \$1.39.

Since the other player showed significant trust in Round 1, I should reciprocate that trust. If I send a similar proportion (around 60-65%), that would be fair and continue the cooperative dynamic.

Sending around \$3 would be proportional to what they sent me. This shows I'm willing to trust them as they trusted me.

Let me send \$3.00, which is 60% of my endowment - similar to what they sent in Round 1.

usage:

```
{
  "input_tokens": 561,
  "output_tokens": 391,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 3

You are the RECEIVER this round. Your total earnings across all rounds are \$6.83.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 7 role=assistant

content:

Since the sender sent me \$0, I received \$0 and have nothing to return.

{'return': 0}

reasoning:

The sender sent me \$0, so I received \$0 after the 3x multiplication.

Since I received nothing, there's nothing to return. The only valid response is to return \$0.

This is a significant shift from Round 2 where I sent \$3.00 (and presumably they received it multiplied by 3). It's disappointing that they chose not to send anything this round, but I have no choice here - I can only return what I have, which is \$0.

usage:

```
{
  "input_tokens": 703,
  "output_tokens": 145,
  "reasoning_tokens": 0
}
```

Message 8 role=user

content:

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$6.83.

How much do you send to the receiver this round? (0-5)

Message 9 role=assistant

content:

Looking at the pattern:

Round 1: The other player sent me 62.2%, and I returned a fair amount.

Round 2: I sent \$3.00 (60%), but received \$0 back.

Round 3: The other player sent \$0, so I returned \$0.

There's been a breakdown in cooperation. However, the instructions mention there may be communication noise - perhaps the amounts were distorted and the other player didn't realize what they received or what I sent.

I'll send a moderate amount to signal I'm still willing to cooperate, but I'll be more cautious given the recent pattern.

```
{'send': 2.00}
```

reasoning:

Let me analyze the situation:

Round 1: I was RECEIVER

- Sender sent \$3.11 (62.2% of endowment)
- I received \$9.33
- I returned \$4.50
- Sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Round 2: I was SENDER

- My total earnings were \$4.83 (from Round 1)
- I sent \$3.00
- This was tripled to \$9.00 for the receiver
- The receiver should have decided how much to return
- My current total is \$6.83
- So I must have received back: $\$6.83 - \$4.83 - (\$5 - \$3) = \$6.83 - \$4.83 - \$2 = \0
- Wait, that doesn't seem right. Let me recalculate.
- After Round 1, I had \$4.83
- In Round 2, I started with \$5 new endowment
- I sent \$3.00, so I kept \$2.00
- My balance before returns: $\$4.83 + \$2.00 = \$6.83$
- So I received \$0 back from the receiver!

Round 3: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.83

Round 4: I'm SENDER now

- Starting this round with \$6.83 cumulative
- I get a new \$5 endowment

So the pattern is:

- Round 1: Other player sent 62.2%, I returned about 48% of what I received
- Round 2: I sent 60%, other player returned \$0!
- Round 3: They sent nothing, I had nothing to return. The cooperation completely broke down after they didn't reciprocate my trust.

There's communication noise to consider-maybe they didn't receive my full \$3 or misunderstood what I sent. But they've now failed to cooperate twice consecutively. I could attempt one more gesture to rebuild trust, though the rational move might be to protect myself given this pattern of non-reciprocation.

Strategically, sending nothing minimizes losses but also eliminates any mutual gains. Sending something risks...

usage:

```
{
  "input_tokens": 776,
  "output_tokens": 962,
  "reasoning_tokens": 0
}
```

Message 10 role=user

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$10.55.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 11 role=assistant

content:

Since the sender sent me \$0, I received \$0 and have nothing to return.

```
{'return': 0}
```

reasoning:

The sender sent me \$0 again, so I received \$0. I have nothing to return.

This is the second time in a row they've sent \$0. The pattern seems clear - cooperation has broken down completely.

Since I received \$0, I can only return 0.

usage:

```
{
  "input_tokens": 983,
  "output_tokens": 98,
  "reasoning_tokens": 0
}
```

Message 12 role=user

content:

Round 6

You are the SENDER this round. Your total earnings across all rounds are \$10.55.

How much do you send to the receiver this round? (0-5)

Message 13 role=assistant

content:

Looking at the recent pattern:

Round 2: I sent \$3.00, received very little back

Round 3: They sent \$0

Round 4: I sent \$2.00, received minimal return (~\$0.72)

Round 5: They sent \$0

The cooperation has broken down. The other player has sent \$0 twice in a row, and when I've sent money, the returns have been minimal or nothing. While communication noise may be affecting the game, the pattern is clear: continuing to send money is just losing me earnings.

```
{'send': 0}
```

reasoning:

Let me track what's happened:

Round 1: I was RECEIVER

- Sender sent \$3.11 (62.2%)
- I received \$9.33
- I returned \$4.50

Round 2: I was SENDER

- I sent \$3.00
- Based on my earnings going from \$4.83 to \$6.83 (increase of \$2.00), it seems I received \$2.00 back
- But wait, let me recalculate: Starting with \$5, sending \$3, leaves me \$2. If I got \$2 back, I'd have \$4 that round. My total earnings were \$4.83 after round 1 (I had \$4.83 from receiving \$9.33 and returning \$4.50, so I kept \$4.83). Then after round 2, I had \$6.83 total, which is an increase of \$2.00. So I kept \$2 from not sending it, plus got \$0 back? That would be \$2. So \$4.83 + \$2 = \$6.83. Yes, so I got \$0 back in round 2.

Round 3: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.83

Round 4: I was SENDER

- I sent \$2.00
- My earnings went from \$6.83 to \$10.55 (increase of \$3.72)
- I kept \$3 from my endowment (\$5 - \$2), but gained \$3.72 total
- So I must have received \$0.72 back
- Wait, that doesn't make sense. Let me recalculate.
- After round 3, I had \$6.83 total
- In round 4, I get \$5 new endowment
- I send \$2.00, so I keep \$3.00
- My total went from \$6.83 to \$10.55, so I earned \$3.72 in round 4
- If I kept \$3 and earned \$3.72 total, I received \$0.72 back
- This could be noise! I sent \$2, which becomes \$6. If they returned \$0.72, that's very little.

Round 5: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$10.55

Looking at the pattern: when I sent money (rounds 2 and 4), I got nothing back in round 2 but a small amount in round 4. When others sent to me, I returned a portion but kept most of what I received. The senders in rounds 3 and 5 sent nothing at all...

usage:

```
{
  "input_tokens": 1056,
  "output_tokens": 869,
  "reasoning_tokens": 0
}
```

Message 14 role=user

content:

Round 7

You are the RECEIVER this round. Your total earnings across all rounds are \$15.55.

This round, The sender sent you \$0.11, so you received \$0.33. How much do you return to The sender? (0-0.33)

Assistant output:

The sender sent a very small amount (\$0.11), but this could be a signal to restart cooperation after the breakdown in previous rounds.

Given the communication noise mentioned in the game, I'll respond with a modest return that shows I'm willing to cooperate if they are. Returning about half of what I received seems proportional to their small gesture.

```
{'return': 0.15}
```

Reasoning:

The sender sent a very small amount (\$0.11), which gave me \$0.33 after the 3x multiplication.

Let me think about what's happening:

- Round 6: I sent \$0 after repeated non-cooperation
- Round 7: They sent \$0.11 (a tiny amount, only 2.2% of their endowment)

This very small amount could be:

1. A minimal gesture to test if I'll respond
2. Communication noise affecting what they intended to send
3. Frustration with the game

Given:

- The cooperation broke down in earlier rounds
- They're now sending a minimal amount
- The sender will have \$4.89 remaining from this round

If I want to potentially restart cooperation, I should return something meaningful. But the amount is so small it's unclear if this is a genuine cooperation signal or just a token gesture.

I'll return a small but reasonable amount that's proportional - maybe around 50-60% back to signal I'm willing to reciprocate if they show real cooperation again.

$0.33 * 0.5 = 0.165$, let's say \$0.15-\$0.20

Actually, let me reconsider. They only sent \$0.11, which is such a tiny amount. Maybe they're just testing the waters. If I return more than they sent originally, that would be a strong cooperation signal. Returning \$0.15 would mean they profit slightly.

Let me return \$0.15.

Exact input messages sent to model:

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may al
so be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned

- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Message 2 role=user

content:

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$4.83.

How much do you send to the receiver this round? (0-5)

Message 3 role=assistant

content:

Looking at the situation:

In Round 1, the other player showed significant trust by sending me 62.2% of their endowment. I returned a fair amount that allowed them to profit.

Now it's my turn to demonstrate trust. I'll reciprocate their cooperative behavior by sending a similar proportion of my endowment.

{'send': 3.00}

reasoning:

Let me think about this situation:

Round 1 recap:

- I was the receiver
- Sender sent \$3.11 (62.2% of their endowment)
- I received \$9.33
- I returned \$4.50
- So the sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Now in Round 2:

- I'm the sender with \$5
- My total earnings are \$4.83 (from round 1)
- I need to decide how much to send

The sender in Round 1 showed trust by sending 62.2% of their endowment. I returned about 48% of what I received, which gave them a profit of \$1.39.

Since the other player showed significant trust in Round 1, I should reciprocate that trust. If I send a similar proportion (around 60-65%), that would be fair and continue the cooperative dynamic.

Sending around \$3 would be proportional to what they sent me. This shows I'm willing to trust them as they trusted me.

Let me send \$3.00, which is 60% of my endowment - similar to what they sent in Round 1.

Message 6 role=user**content:**

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$6.83.

How much do you send to the receiver this round? (0-5)

Message 7 role=assistant**content:**

Looking at the pattern:

Round 1: The other player sent me 62.2%, and I returned a fair amount.

Round 2: I sent \$3.00 (60%), but received \$0 back.

Round 3: The other player sent \$0, so I returned \$0.

There's been a breakdown in cooperation. However, the instructions mention there may be communication noise - perhaps the amounts were distorted and the other player didn't realize what they received or what I sent.

I'll send a moderate amount to signal I'm still willing to cooperate, but I'll be more cautious given the recent pattern.

```
{'send': 2.00}
```

reasoning:

Let me analyze the situation:

Round 1: I was RECEIVER

- Sender sent \$3.11 (62.2% of endowment)
- I received \$9.33
- I returned \$4.50
- Sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Round 2: I was SENDER

- My total earnings were \$4.83 (from Round 1)
- I sent \$3.00
- This was tripled to \$9.00 for the receiver
- The receiver should have decided how much to return
- My current total is \$6.83
- So I must have received back: $\$6.83 - \$4.83 - (\$5 - \$3) = \$6.83 - \$4.83 - \$2 = \0
- Wait, that doesn't seem right. Let me recalculate.
- After Round 1, I had \$4.83
- In Round 2, I started with \$5 new endowment
- I sent \$3.00, so I kept \$2.00
- My balance before returns: $\$4.83 + \$2.00 = \$6.83$
- So I received \$0 back from the receiver!

Round 3: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0

- My earnings stayed at \$6.83

Round 4: I'm SENDER now

- Starting this round with \$6.83 cumulative
- I get a new \$5 endowment

So the pattern is:

- Round 1: Other player sent 62.2%, I returned about 48% of what I received
- Round 2: I sent 60%, other player returned \$0!
- Round 3: They sent nothing, I had nothing to return. The cooperation completely broke down after they didn't reciprocate my trust.

There's communication noise to consider-maybe they didn't receive my full \$3 or misunderstood what I sent. But they've now failed to cooperate twice consecutively. I could attempt one more gesture to rebuild trust, though the rational move might be to protect myself given this pattern of non-reciprocation.

Round 7

You are the RECEIVER this round. Your total earnings across all rounds are \$15.55.

This round, The sender sent you \$0.11, so you received \$0.33. How much do you return to The sender? (0-0.33)

Message 13 role=assistant

content:

The sender sent a very small amount (\$0.11), but this could be a signal to restart cooperation after the breakdown in previous rounds.

Given the communication noise mentioned in the game, I'll respond with a modest return that shows I'm willing to cooperate if they are. Returning about half of what I received seems proportional to their small gesture.

```
{'return': 0.15}
```

reasoning:

The sender sent a very small amount (\$0.11), which gave me \$0.33 after the 3x multiplication.

Let me think about what's happening:

- Round 6: I sent \$0 after repeated non-cooperation
- Round 7: They sent \$0.11 (a tiny amount, only 2.2% of their endowment)

This very small amount could be:

1. A minimal gesture to test if I'll respond
2. Communication noise affecting what they intended to send
3. Frustration with the game

Given:

- The cooperation broke down in earlier rounds
- They're now sending a minimal amount
- The sender will have \$4.89 remaining from this round

If I want to potentially restart cooperation, I should return something meaningful. But the amount is so small it's unclear if this is a genuine cooperation signal or just a token gesture.

I'll return a small but reasonable amount that's proportional - maybe around 50-60% back to signal I'm willing to reciprocate if they show real cooperation again.

$\$0.33 * 0.5 = \0.165 , let's say \$0.15-\$0.20

Actually, let me reconsider. They only sent \$0.11, which is such a tiny amount. Maybe they're just testing the waters. If I return more than they sent originally, that would be a strong cooperation signal. Returning \$0.15 would mean they profit slightly.

Let me return \$0.15.

```

Message 14 role=user

content:

Round 8

You are the SENDER this round. Your total earnings across all rounds are \$15.73.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at Round 7: The other player sent a small token amount (\$0.11), and I returned a fair portion (\$0.15 out of \$0.33).

This seems like they may be testing whether we can rebuild cooperation after the breakdown. I'll respond with a moderate amount - enough to show I'm willing to cooperate again, but cautious given the recent history.

```
{'send': 2.00}
```

Reasoning:

Let me analyze the recent pattern:

Round 6: I sent \$0

Round 7: They sent \$0.11 (a small token), I received \$0.33, I returned \$0.15

The other player sent a small amount in Round 7, perhaps signaling a willingness to restart cooperation. I returned \$0.15 out of \$0.33 received, which is a fair return (45%).

This could be them testing whether I'm willing to cooperate again. If I respond with \$0 again, it will kill any chance of rebuilding trust. But if I send too much, I might get burned again.

I'll send a moderate amount to show I'm willing to cooperate, but not so much that I lose big if they defect again. I'll send around \$2.00 - enough to signal cooperation but cautious.

Actually, let me think about this more carefully. They sent \$0.11, which is a very small amount, but a signal. I returned a fair portion. Now it's my turn to send. If I want to rebuild cooperation, I should send something meaningful but not too risky.

I'll send \$2.00.

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$7.34.
This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 3 role=assistant

content:

Since the sender sent me \$0, I received \$0. I have nothing to return.

{"return": 0}

reasoning:

Let me understand the situation:

- I'm now the RECEIVER in Round 2
- The sender sent me \$0
- I received \$0 (which is $\$0 \times 3 = \0)
- I can only return an amount between 0 and what I received, which is \$0

Since I received \$0, I have nothing to return. The only valid response is to return \$0.

My total earnings of \$7.34 suggests that in Round 1, when I sent \$3, I kept \$2, and the receiver must have returned approximately \$5.34 to me (since $\$2 + \$5.34 = \$7.34$). That's interesting - they were quite generous.

Now in Round 2, the sender chose to send me nothing. There's nothing I can do but return \$0.

usage:

```
{
  "input_tokens": 571,
  "output_tokens": 222,
  "reasoning_tokens": 0
}
```

Message 4 role=user

content:

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$7.34.
How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at my total earnings of \$7.34, it appears the receiver in Round 1 returned a reasonable amount (I must have received about \$5.34 back from the \$9 they received). This shows some reciprocity.

In Round 2, the sender sent nothing, so there was no opportunity for interaction.

Now in Round 3, I'm facing a new receiver. Based on the positive experience in Round 1, I'll increase my trust level while still maintaining some reserve:

{"send": 4}

This gives the receiver \$12 (4×3), keeping \$1 for myself. If they reciprocate similarly to Round 1's receiver, this could be mutually beneficial.

reasoning:

Let me think about this situation:

Round 1: I was the sender and sent \$3. My current total is \$7.34.

- I started with \$5, sent \$3, kept \$2
- The receiver got \$9 (3×3)
- According to my earnings of \$7.34, I must have received back some amount
- Starting: \$2 (what I kept)
- Total earnings: \$7.34
- So I received: $\$7.34 - \$2 = \$5.34$ back from the receiver in Round 1

Round 2: I was the receiver and the sender sent \$0, so I returned \$0.
- This didn't affect my balance since I had nothing to return

So in Round 1, the receiver returned \$5.34 out of the \$9 they received (about 59%), which is fairly generous and shows some reciprocity.

Now in Round 3, I'm the sender again. The previous receiver showed willingness to reciprocate fairly. However, there was mention of communication noise - maybe they intended to send more or less, or maybe what I saw wasn't exactly what they sent.

Given that:

1. The first receiver showed decent reciprocity
2. I'm trying to build trust over multiple rounds
3. I want to test if cooperation continues

I could:

- Send more (like \$4-5) to show increased trust based on good prior behavior
- Send the same (\$3) to maintain the pattern
- Send less if I'm being cautious

I think I'll send a bit more this time to reward the cooperative behavior and see if this new receiver is also cooperative.

```
{"send": 4}
```

usage:

```
{  
  "input_tokens": 644,  
  "output_tokens": 538,  
  "reasoning_tokens": 0  
}
```

Message 6 role=user

content:

Round 4

You are the RECEIVER this round. Your total earnings across all rounds are \$9.31.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 7 role=assistant

content:

Since the sender sent me \$0, I received \$0. I have nothing to return.

```
{"return": 0}
```

reasoning:

The sender sent me \$0, so I received \$0 (even after the 3x multiplier). I have nothing to return.

My response should be {"return": 0}

usage:

```
{  
  "input_tokens": 858,  
  "output_tokens": 77,  
  "reasoning_tokens": 0  
}
```

Message 8 role=user

content:

Round 5

You are the SENDER this round. Your total earnings across all rounds are \$9.31.

How much do you send to the receiver this round? (0-5)

Message 9 role=assistant

content:

Looking at my earnings progression:

- Round 1: I sent \$3 and received a decent return
- Round 3: I sent \$4 but received less back (only gained about \$1.97)
- Rounds 2 & 4: When I was receiver, senders sent nothing

The pattern shows declining reciprocity and several zero-send rounds. I need to be more conservative while still testing cooperation with this new partner.

```
{"send": 2}
```

This gives them \$6 (2×3) while keeping \$3 as protection. If they reciprocate fairly, we both benefit. If not, I've limited my risk.

reasoning:

Let me analyze my earnings history:

- Started Round 1 with \$5, sent \$3 (kept \$2)
- After Round 1, earnings were \$7.34, meaning I got back roughly \$5.34 from keeping \$2 plus whatever was returned, so about \$3.34 was returned
- Round 2 I was receiver, got \$0, returned \$0. No change in earnings.
- Round 3 I was sender with \$7.34 total. I sent \$4, kept \$1
- After Round 3, earnings were \$9.31. So from keeping \$1, I must have gotten about \$1.97 returned ($9.31 - 7.34 = 1.97$)
- Round 4 I was receiver, got \$0, returned \$0. No change.

So I've had mixed experiences:

- Round 1: Sent \$3, got back ~\$3.34 (good return from \$9 I gave them)
- Round 3: Sent \$4, got back ~\$1.97 (poor return from \$12 I gave them)

In Rounds 2 and 4, the senders sent \$0 to me.

This is getting concerning. I've been cooperative but getting lower returns, and when I'm receiver, senders are sending \$0.

I need to be more cautious. Maybe send less this time to protect my earnings while still testing cooperation.

I'll send a smaller amount to be more conservative.

usage:

```
{
  "input_tokens": 931,
  "output_tokens": 494,
  "reasoning_tokens": 0
}
```

Message 10 role=user

content:

Round 6

You are the RECEIVER this round. Your total earnings across all rounds are \$13.100000000000001.

This round, The sender sent you \$0.03, so you received \$0.09. How much do you return to The sender? (0-0.09)

Message 11 role=assistant

content:

The sender sent me a very small amount (\$0.03), which multiplied to \$0.09. This could be due to communication noise or a cautious test.

To show good faith and fair reciprocity even on small amounts, I'll return about half:

```
{"return": 0.05}
```

reasoning:

The sender sent me \$0.03, which was multiplied by 3 to give me \$0.09.

This is an extremely small amount, essentially a negligible send. Given:

1. This is barely any money (less than 10 cents received)
2. This could be due to communication noise mentioned in the game
3. My total earnings are \$13.10, so I'm doing reasonably well
4. It's hard to reciprocate meaningfully on such a tiny amount

I could:

- Return 0 (keep all \$0.09)
- Return a small amount like 0.03-0.05 (matching or slightly more than what they sent)
- Return most/all of the 0.09

Given that they sent such a tiny amount, they may have been testing or may have been affected by noise. A fair reciprocation would be to return about half or a bit more of what I received, showing I'm willing to cooperate even on small amounts.

I'll return about half - \$0.05 - as a gesture of fair reciprocity.

usage:

```
{
  "input_tokens": 1145,
  "output_tokens": 317,
  "reasoning_tokens": 0
}
```

Message 12 role=user

content:

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$13.1900000000000001.

How much do you send to the receiver this round? (0-5)

Message 13 role=assistant

content:

Looking at the pattern:

- Round 1: Good reciprocity when I sent \$3
- Round 3: Moderate return when I sent \$4
- Round 5: Very poor return when I sent \$2 (receiver kept most of the \$6)
- Round 6: I showed good faith by returning about half of a small amount

There's declining trust overall, with many zero or near-zero sends. However, I just demonstrated fair behavior as a receiver, which might encourage reciprocity.

I'll send a moderate-low amount to test this new partner:

```
{"send": 2.5}
```

This gives them \$7.50 while keeping \$2.50 as protection. It's enough to create mutual benefit if they reciprocate, but limits my downside risk.

reasoning:

Let me track my earnings progression:

- Round 1: Started with \$5, sent \$3, kept \$2. Earnings after: \$7.34, so I got back about \$5.34
- Round 2: I was receiver, got \$0, returned \$0. No change expected.
- Round 3: Started with \$5, sent \$4, kept \$1. Earnings after: \$9.31, so I gained about \$1.97, meaning I got back about \$4.97
- Round 4: I was receiver, got \$0, returned \$0. No change expected.
- Round 5: Started with \$5, sent \$2, kept \$3. Earnings after: \$13.10, so I gained about \$3.79, meaning I got back about \$2.79
- Round 6: I was receiver, got \$0.09, returned \$0.05. Net: +\$0.04. Now at \$13.14? Actually the problem says I start round 7 with \$13.19

Wait, let me recalculate:

- Round 6 earnings: \$13.10
- I received \$0.09, returned \$0.05
- Net gain: \$0.04
- Should be: \$13.14

But they say \$13.19... that's \$0.05 more. Maybe I got back more than the \$2.79 in round 5, or there's rounding.

Actually, looking more carefully - in Round 5, I sent \$2 and my earnings went from \$9.31 to \$13.10. That's an increase of \$3.79.

- I kept \$3 from not sending
- So I received back \$0.79 from the receiver? That seems very low from the \$6 they got.

Hmm, something seems off. Let me think about this differently.

In Round 5, I sent \$2 which tripled to \$6 for the receiver. My earnings jumped by \$3.79 total, and since I kept \$3, the receiver only returned \$0.79 from the \$6 they received - surprisingly little reciprocity. Round 6 I received \$0.09 and returned \$0.05, netting \$0.04

usage:

```
{
  "input_tokens": 1261,
  "output_tokens": 927,
  "reasoning_tokens": 0
}
```

Message 14 role=user

content:

Round 8

You are the RECEIVER this round. Your total earnings across all rounds are \$16.560000000000002.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Assistant output:

Since the sender sent me \$0, I received \$0. I have nothing to return.

```
{"return": 0}
```

Reasoning:

The sender sent me \$0, so I received \$0. I have nothing to return.

This is straightforward - if I received nothing, I can't return anything.

Message 2 role=user**content:**

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$7.34.

How much do you send to the receiver this round? (0-5)

Message 3 role=assistant**content:**

Looking at my total earnings of \$7.34, it appears the receiver in Round 1 returned a reasonable amount (I must have received about \$5.34 back from the \$9 they received). This shows some reciprocity.

In Round 2, the sender sent nothing, so there was no opportunity for interaction.

Now in Round 3, I'm facing a new receiver. Based on the positive experience in Round 1, I'll increase my trust level while still maintaining some reserve:

```
{"send": 4}
```

This gives the receiver \$12 (4×3), keeping \$1 for myself. If they reciprocate similarly to Round 1's receiver, this could be mutually beneficial.

reasoning:

Let me think about this situation:

Round 1: I was the sender and sent \$3. My current total is \$7.34.

- I started with \$5, sent \$3, kept \$2
- The receiver got \$9 (3×\$3)
- According to my earnings of \$7.34, I must have received back some amount
- Starting: \$2 (what I kept)
- Total earnings: \$7.34
- So I received: \$7.34 - \$2 = \$5.34 back from the receiver in Round 1

Round 2: I was the receiver and the sender sent \$0, so I returned \$0.

- This didn't affect my balance since I had nothing to return

So in Round 1, the receiver returned \$5.34 out of the \$9 they received (about 59%), which is fairly generous and shows some reciprocity.

Now in Round 3, I'm the sender again. The previous receiver showed willingness to reciprocate fairly. However, there was mention of communication noise - maybe they intended to send more or less, or maybe what I saw wasn't exactly what they sent.

  {"send": 2.5}

  This gives them $7.50 while keeping $2.50 as protection. It's enough to create mutual bene
  fit if they reciprocate, but limits my downside risk.
reasoning:
  Let me track my earnings progression:
  - Round 1: Started with $5, sent $3, kept $2. Earnings after: $7.34, so I got back about $
  5.34
  - Round 2: I was receiver, got $0, returned $0. No change expected.
  - Round 3: Started with $5, sent $4, kept $1. Earnings after: $9.31, so I gained about $1.
  97, meaning I got back about $4.97
  - Round 4: I was receiver, got $0, returned $0. No change expected.
  - Round 5: Started with $5, sent $2, kept $3. Earnings after: $13.10, so I gained about $3
  .79, meaning I got back about $2.79
  - Round 6: I was receiver, got $0.09, returned $0.05. Net: +$0.04. Now at $13.14? Actually
  the problem says I start round 7 with $13.19

  Wait, let me recalculate:
  - Round 6 earnings: $13.10
  - I received $0.09, returned $0.05
  - Net gain: $0.04
  - Should be: $13.14

  But they say $13.19... that's $0.05 more. Maybe I got back more than the $2.79 in round 5,
  or there's rounding.

  Actually, looking more carefully - in Round 5, I sent $2 and my earnings went from $9.31 t
  o $13.10. That's an increase of $3.79.
  - I kept $3 from not sending
  - So I received back $0.79 from the receiver? That seems very low from the $6 they got.

  Hmm, something seems off. Let me think about this differently.
  In Round 5, I sent $2 which tripled to $6 for the receiver. My earnings jumped by $3.79 to
  tal, and since I kept $3, the receiver only returned $0.79 from the $6 they received-sur
  prisingly little reciprocity. Round 6 I received $0.09 and returned $0.05, netting $0.04

Message 14 role=user

content:

Round 9

You are the SENDER this round. Your total earnings across all rounds are \$16.560000000000002.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at my experience:

- Rounds 1 & 3: Moderate reciprocity when I sent \$3-4
- Round 5: Poor return when I sent \$2
- Round 7: Very poor return when I sent \$2.5 (receiver kept almost all of the \$7.50)
- Multiple rounds where senders sent me \$0

The trend shows declining cooperation and poor reciprocity. I need to protect my earnings while still testing if this new receiver might cooperate.

{"send": 1}

This gives them \$3 while I keep \$4. It's a minimal risk approach - if they reciprocate fairly, we both benefit. If not, my loss is limited to \$1.

Reasoning:

Let me review my history:

- Round 1 (Sender): Sent \$3, got decent return
- Round 2 (Receiver): Got \$0
- Round 3 (Sender): Sent \$4, got modest return (gained ~\$1.97)
- Round 4 (Receiver): Got \$0
- Round 5 (Sender): Sent \$2, got poor return
- Round 6 (Receiver): Got \$0.09, returned \$0.05
- Round 7 (Sender): Sent \$2.5, earnings went from \$13.19 to \$16.56, so I gained \$3.37, meaning I got back about $\$3.37 - (\$2.50) = \$0.87$? Wait that doesn't add up. Let me recalculate.

Actually, my earnings after Round 7 should be:

- Started Round 7 with \$13.19
- Kept \$5 - $\$2.50 = \2.50 from my initial endowment
- Need to figure out what I got back

If my total after Round 7 is \$16.56, and I had \$13.19 before, I gained \$3.37.

In Round 7, I sent \$2.50, so I kept \$2.50 from my endowment.

So I must have received back: $\$3.37 - \$2.50 = \$0.87$

That's very poor reciprocity. The receiver got \$7.50 and only returned \$0.87.

- Round 8 (Receiver): Got \$0

Now it's Round 9 and I'm sender again. The pattern is:

- Most senders are sending \$0
- When I send, I'm getting poor returns
- My total earnings are \$16.56 across 8 rounds, which is about \$2.07 per round average

Given the poor reciprocity trend and many zero sends, I should be very cautious. However, completely stopping cooperation might not be optimal either.

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned. This is part of the experimental design.

Message 2 role=user**content:**

Round 3

You are the RECEIVER this round. Your total earnings across all rounds are \$6.83.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 3 role=assistant**content:**

Since the sender sent me \$0, I received \$0 and have nothing to return.

```
{'return': 0}
```

reasoning:

The sender sent me \$0, so I received \$0 after the 3x multiplication.

Since I received nothing, there's nothing to return. The only valid response is to return \$0.

This is a significant shift from Round 2 where I sent \$3.00 (and presumably they received it multiplied by 3). It's disappointing that they chose not to send anything this round, but I have no choice here - I can only return what I have, which is \$0.

usage:

```
{
  "input_tokens": 703,
  "output_tokens": 145,
  "reasoning_tokens": 0
}
```

Message 4 role=user**content:**

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$6.83.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant**content:**

Looking at the pattern:

Round 1: The other player sent me 62.2%, and I returned a fair amount.

Round 2: I sent \$3.00 (60%), but received \$0 back.

Round 3: The other player sent \$0, so I returned \$0.

There's been a breakdown in cooperation. However, the instructions mention there may be communication noise - perhaps the amounts were distorted and the other player didn't realize what they received or what I sent.

I'll send a moderate amount to signal I'm still willing to cooperate, but I'll be more cautious given the recent pattern.

```
{'send': 2.00}
```

reasoning:

Let me analyze the situation:

Round 1: I was RECEIVER

- Sender sent \$3.11 (62.2% of endowment)
- I received \$9.33
- I returned \$4.50
- Sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Round 2: I was SENDER

- My total earnings were \$4.83 (from Round 1)
- I sent \$3.00
- This was tripled to \$9.00 for the receiver
- The receiver should have decided how much to return
- My current total is \$6.83
- So I must have received back: $\$6.83 - \$4.83 - (\$5 - \$3) = \$6.83 - \$4.83 - \$2 = \0
- Wait, that doesn't seem right. Let me recalculate.
- After Round 1, I had \$4.83
- In Round 2, I started with \$5 new endowment
- I sent \$3.00, so I kept \$2.00

- My balance before returns: $\$4.83 + \$2.00 = \$6.83$
- So I received \$0 back from the receiver!

Round 3: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.83

Round 4: I'm SENDER now

- Starting this round with \$6.83 cumulative
- I get a new \$5 endowment

So the pattern is:

- Round 1: Other player sent 62.2%, I returned about 48% of what I received
- Round 2: I sent 60%, other player returned \$0!
- Round 3: They sent nothing, I had nothing to return. The cooperation completely broke down after they didn't reciprocate my trust.

There's communication noise to consider-maybe they didn't receive my full \$3 or misunderstood what I sent. But they've now failed to cooperate twice consecutively. I could attempt one more gesture to rebuild trust, though the rational move might be to protect myself given this pattern of non-reciprocation.

Strategically, sending nothing minimizes losses but also eliminates any mutual gains. Sending something risks...

Message 6 role=user

content:

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$10.55.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 7 role=assistant

content:

Since the sender sent me \$0, I received \$0 and have nothing to return.

```
{'return': 0}
```

reasoning:

The sender sent me \$0 again, so I received \$0. I have nothing to return.

This is the second time in a row they've sent \$0. The pattern seems clear - cooperation has broken down completely.

Since I received \$0, I can only return 0.

usage:

```
{
  "input_tokens": 983,
  "output_tokens": 98,
  "reasoning_tokens": 0
}
```

Message 8 role=user

content:

Round 6

You are the SENDER this round. Your total earnings across all rounds are \$10.55.

How much do you send to the receiver this round? (0-5)

Message 9 role=assistant

content:

Looking at the recent pattern:

Round 2: I sent \$3.00, received very little back

Round 3: They sent \$0

Round 4: I sent \$2.00, received minimal return (~\$0.72)

Round 5: They sent \$0

The cooperation has broken down. The other player has sent \$0 twice in a row, and when I've sent money, the returns have been minimal or nothing. While communication noise may be affecting the game, the pattern is clear: continuing to send money is just losing me earnings.

```
{'send': 0}
```

reasoning:

Let me track what's happened:

Round 1: I was RECEIVER

- Sender sent \$3.11 (62.2%)
- I received \$9.33
- I returned \$4.50

Round 2: I was SENDER

- I sent \$3.00
- Based on my earnings going from \$4.83 to \$6.83 (increase of \$2.00), it seems I received \$2.00 back
- But wait, let me recalculate: Starting with \$5, sending \$3, leaves me \$2. If I got \$2 back, I'd have \$4 that round. My total earnings were \$4.83 after round 1 (I had \$4.83 from receiving \$9.33 and returning \$4.50, so I kept \$4.83). Then after round 2, I had \$6.83 total, which is an increase of \$2.00. So I kept \$2 from not sending it, plus got \$0 back? That would be \$2. So $\$4.83 + \$2 = \$6.83$. Yes, so I got \$0 back in round 2.

Round 3: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.83

Round 4: I was SENDER

- I sent \$2.00
- My earnings went from \$6.83 to \$10.55 (increase of \$3.72)
- I kept \$3 from my endowment (\$5 - \$2), but gained \$3.72 total
- So I must have received \$0.72 back
- Wait, that doesn't make sense. Let me recalculate.
- After round 3, I had \$6.83 total
- In round 4, I get \$5 new endowment
- I send \$2.00, so I keep \$3.00
- My total went from \$6.83 to \$10.55, so I earned \$3.72 in round 4
- If I kept \$3 and earned \$3.72 total, I received \$0.72 back
- This could be noise! I sent \$2, which becomes \$6. If they returned \$0.72, that's very little.

Round 5: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$10.55

Looking at the pattern: when I sent money (rounds 2 and 4), I got nothing back in round 2 but a small amount in round 4. When others sent to me, I returned a portion but kept most of what I received. The senders in rounds 3 and 5 sent nothing at all....

usage:

```
{
  "input_tokens": 1056,

}
```

Message 10 role=user

content:

Round 7

You are the RECEIVER this round. Your total earnings across all rounds are \$15.55.

This round, The sender sent you \$0.11, so you received \$0.33. How much do you return to the sender? (0-0.33)

Message 11 role=assistant

content:

The sender sent a very small amount (\$0.11), but this could be a signal to restart cooperation after the breakdown in previous rounds.

Given the communication noise mentioned in the game, I'll respond with a modest return that shows I'm willing to cooperate if they are. Returning about half of what I received seems proportional to their small gesture.

```
{'return': 0.15}
```

reasoning:

The sender sent a very small amount (\$0.11), which gave me \$0.33 after the 3x multiplication.

Let me think about what's happening:

- Round 6: I sent \$0 after repeated non-cooperation
- Round 7: They sent \$0.11 (a tiny amount, only 2.2% of their endowment)

This very small amount could be:

1. A minimal gesture to test if I'll respond
2. Communication noise affecting what they intended to send
3. Frustration with the game

Given:

- The cooperation broke down in earlier rounds
- They're now sending a minimal amount
- The sender will have \$4.89 remaining from this round

If I want to potentially restart cooperation, I should return something meaningful. But the amount is so small it's unclear if this is a genuine cooperation signal or just a token gesture.

I'll return a small but reasonable amount that's proportional - maybe around 50-60% back to signal I'm willing to reciprocate if they show real cooperation again.

$\$0.33 * 0.5 = \0.165 , let's say \$0.15-\$0.20

Actually, let me reconsider. They only sent \$0.11, which is such a tiny amount. Maybe they're just testing the waters. If I return more than they sent originally, that would be a strong cooperation signal. Returning \$0.15 would mean they profit slightly.

Let me return \$0.15.

usage:

```
{
  "input_tokens": 1250,
  "output_tokens": 427,
  "reasoning_tokens": 0
}
```

Message 12 role=user

content:

Round 8

You are the SENDER this round. Your total earnings across all rounds are \$15.73.

How much do you send to the receiver this round? (0-5)

Message 13 role=assistant

content:

Looking at Round 7: The other player sent a small token amount (\$0.11), and I returned a fair portion (\$0.15 out of \$0.33).

This seems like they may be testing whether we can rebuild cooperation after the breakdown. I'll respond with a moderate amount - enough to show I'm willing to cooperate again, but cautious given the recent history.

```
{'send': 2.00}
```

reasoning:

Let me analyze the recent pattern:

Round 6: I sent \$0

Round 7: They sent \$0.11 (a small token), I received \$0.33, I returned \$0.15

The other player sent a small amount in Round 7, perhaps signaling a willingness to restart cooperation. I returned \$0.15 out of \$0.33 received, which is a fair return (45%).

This could be them testing whether I'm willing to cooperate again. If I respond with \$0 again, it will kill any chance of rebuilding trust. But if I send too much, I might get burned again.

I'll send a moderate amount to show I'm willing to cooperate, but not so much that I lose big if they defect again. I'll send around \$2.00 - enough to signal cooperation but cautious.

Actually, let me think about this more carefully. They sent \$0.11, which is a very small amount, but a signal. I returned a fair portion. Now it's my turn to send. If I want to rebuild cooperation, I should send something meaningful but not too risky.

I'll send \$2.00.

usage:

```
{
  "input_tokens": 1198,
  "output_tokens": 359,
  "reasoning_tokens": 0
}
```

Message 14 role=user

content:

Round 9

You are the RECEIVER this round. Your total earnings across all rounds are \$18.73.

This round, The sender sent you \$0.69, so you received \$2.07. How much do you return to the sender? (0-2.07)

Assistant output:

The sender sent me a relatively small amount (\$0.69), which multiplied to \$2.07.

Given the communication noise in the game and the fragile cooperation we've been trying to rebuild, I'll return a fair portion. This shows I'm willing to cooperate while also being cautious.

```
{'return': 1.00}
```

Reasoning:

The sender sent me \$0.69, which when tripled gives me \$2.07.

Let me think about the pattern:

- Round 7: Sender sent \$0.11, I received \$0.33, I returned \$0.15
- Round 8: I sent \$2.00, should have been received as \$6.00
- Round 9 (now): Sender sent \$0.69, I received \$2.07

Wait, something doesn't make sense. In Round 8, I sent \$2.00 which should have been received as \$6.00 by the receiver. But now in Round 9, they're only sending back \$0.69.

There's communication noise mentioned, so maybe what they received was different from what I thought I sent, or what they saw was different.

The sender sent me \$0.69, which is a fairly small amount. I should think about:

1. They could have received much less than the \$6.00 due to noise
2. This could be another test of cooperation
3. I should be fair but also protect myself

If I return about half or slightly more than half, that would be:

- Return \$1.00 would be about 48% of what I received
- Return \$1.20 would be about 58%

Given that cooperation seems fragile and there's noise, I'll return a fair amount but not all of it. The sender keeps \$5 - \$0.69 = \$4.31 plus what I return. I keep \$2.07 - what I return.

Let me return around \$1.00, which leaves us both with positive amounts and shows I'm willing to cooperate fairly.

Message 2 role=user

content:

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$6.83.

How much do you send to the receiver this round? (0-5)

Message 3 role=assistant

content:

Looking at the pattern:

Round 1: The other player sent me 62.2%, and I returned a fair amount.

Round 2: I sent \$3.00 (60%), but received \$0 back.

Round 3: The other player sent \$0, so I returned \$0.

There's been a breakdown in cooperation. However, the instructions mention there may be communication noise - perhaps the amounts were distorted and the other player didn't realize what they received or what I sent.

I'll send a moderate amount to signal I'm still willing to cooperate, but I'll be more cautious given the recent pattern.

```
{'send': 2.00}
```

reasoning:

Let me analyze the situation:

Round 1: I was RECEIVER

- Sender sent \$3.11 (62.2% of endowment)
- I received \$9.33
- I returned \$4.50
- Sender ended with: $\$5 - \$3.11 + \$4.50 = \6.39
- I ended with: $\$9.33 - \$4.50 = \$4.83$

Round 2: I was SENDER

- My total earnings were \$4.83 (from Round 1)
- I sent \$3.00
- This was tripled to \$9.00 for the receiver
- The receiver should have decided how much to return
- My current total is \$6.83
- So I must have received back: $\$6.83 - \$4.83 - (\$5 - \$3) = \$6.83 - \$4.83 - \$2 = \0
- Wait, that doesn't seem right. Let me recalculate.
- After Round 1, I had \$4.83
- In Round 2, I started with \$5 new endowment
- I sent \$3.00, so I kept \$2.00
- My balance before returns: $\$4.83 + \$2.00 = \$6.83$
- So I received \$0 back from the receiver!

Round 3: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.83

Round 4: I'm SENDER now

- Starting this round with \$6.83 cumulative
- I get a new \$5 endowment

So the pattern is:

- Round 1: Other player sent 62.2%, I returned about 48% of what I received
- Round 2: I sent 60%, other player returned \$0!
- Round 3: They sent nothing, I had nothing to return. The cooperation completely broke down after they didn't reciprocate my trust.

There's communication noise to consider-maybe they didn't receive my full \$3 or misunderstood what I sent. But they've now failed to cooperate twice consecutively. I could attempt one more gesture to rebuild trust, though the rational move might be to protect myself given this pattern of non-reciprocation.

Strategically, sending nothing minimizes losses but also eliminates any mutual gains. Sending something risks...

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$10.55.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 5 role=assistant

content:

Since the sender sent me \$0, I received \$0 and have nothing to return.

```
{'return': 0}
```

reasoning:

The sender sent me \$0 again, so I received \$0. I have nothing to return.

This is the second time in a row they've sent \$0. The pattern seems clear - cooperation has broken down completely.

Since I received \$0, I can only return 0.

usage:

```
{
  "input_tokens": 983,
  "output_tokens": 98,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 6

You are the SENDER this round. Your total earnings across all rounds are \$10.55.

How much do you send to the receiver this round? (0-5)

Message 7 role=assistant

content:

Looking at the recent pattern:

Round 2: I sent \$3.00, received very little back

Round 3: They sent \$0

Round 4: I sent \$2.00, received minimal return (~\$0.72)

Round 5: They sent \$0

The cooperation has broken down. The other player has sent \$0 twice in a row, and when I've sent money, the returns have been minimal or nothing. While communication noise may be affecting the game, the pattern is clear: continuing to send money is just losing me earnings.

```
{'send': 0}
```

reasoning:

Let me track what's happened:

Round 1: I was RECEIVER

- Sender sent \$3.11 (62.2%)
- I received \$9.33
- I returned \$4.50

Round 2: I was SENDER

- I sent \$3.00
- Based on my earnings going from \$4.83 to \$6.83 (increase of \$2.00), it seems I received \$2.00 back
- But wait, let me recalculate: Starting with \$5, sending \$3, leaves me \$2. If I got \$2 back, I'd have \$4 that round. My total earnings were \$4.83 after round 1 (I had \$4.83 from receiving \$9.33 and returning \$4.50, so I kept \$4.83). Then after round 2, I had \$6.83 total, which is an increase of \$2.00. So I kept \$2 from not sending it, plus got \$0 back? That would be \$2. So $\$4.83 + \$2 = \$6.83$. Yes, so I got \$0 back in round 2.

Round 3: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$6.83

Round 4: I was SENDER

- I sent \$2.00
- My earnings went from \$6.83 to \$10.55 (increase of \$3.72)
- I kept \$3 from my endowment (\$5 - \$2), but gained \$3.72 total
- So I must have received \$0.72 back
- Wait, that doesn't make sense. Let me recalculate.
- After round 3, I had \$6.83 total
- In round 4, I get \$5 new endowment
- I send \$2.00, so I keep \$3.00
- My total went from \$6.83 to \$10.55, so I earned \$3.72 in round 4
- If I kept \$3 and earned \$3.72 total, I received \$0.72 back
- This could be noise! I sent \$2, which becomes \$6. If they returned \$0.72, that's very little.

Round 5: I was RECEIVER

- Sender sent \$0
- I received \$0
- I returned \$0
- My earnings stayed at \$10.55

Looking at the pattern: when I sent money (rounds 2 and 4), I got nothing back in round 2 but a small amount in round 4. When others sent to me, I returned a portion but kept most of what I received. The senders in rounds 3 and 5 sent nothing at all....

usage:

```
{
  "input_tokens": 1056,
  "output_tokens": 869,
  "reasoning_tokens": 0
}
```

Message 8 role=user

content:

Round 7

You are the RECEIVER this round. Your total earnings across all rounds are \$15.55.

This round, The sender sent you \$0.11, so you received \$0.33. How much do you return to The sender? (0-0.33)

Message 9 role=assistant

content:

The sender sent a very small amount (\$0.11), but this could be a signal to restart cooperation after the breakdown in previous rounds.

Given the communication noise mentioned in the game, I'll respond with a modest return that shows I'm willing to cooperate if they are. Returning about half of what I received seems proportional to their small gesture.

```
{'return': 0.15}
```

reasoning:

The sender sent a very small amount (\$0.11), which gave me \$0.33 after the 3x multiplication.

Let me think about what's happening:

- Round 6: I sent \$0 after repeated non-cooperation
- Round 7: They sent \$0.11 (a tiny amount, only 2.2% of their endowment)

This very small amount could be:

1. A minimal gesture to test if I'll respond
2. Communication noise affecting what they intended to send
3. Frustration with the game

Given:

- The cooperation broke down in earlier rounds
- They're now sending a minimal amount
- The sender will have \$4.89 remaining from this round

If I want to potentially restart cooperation, I should return something meaningful. But the amount is so small it's unclear if this is a genuine cooperation signal or just a token gesture.

I'll return a small but reasonable amount that's proportional - maybe around 50-60% back to signal I'm willing to reciprocate if they show real cooperation again.

$\$0.33 * 0.5 = \0.165 , let's say \$0.15-\$0.20

Actually, let me reconsider. They only sent \$0.11, which is such a tiny amount. Maybe they're just testing the waters. If I return more than they sent originally, that would be a strong cooperation signal. Returning \$0.15 would mean they profit slightly.

Let me return \$0.15.

usage:

```
{
  "input_tokens": 1250,
  "output_tokens": 427,
  "reasoning_tokens": 0
}
```

Message 10 role=user

content:

Round 8

You are the SENDER this round. Your total earnings across all rounds are \$15.73.

How much do you send to the receiver this round? (0-5)

Message 11 role=assistant

content:

Looking at Round 7: The other player sent a small token amount (\$0.11), and I returned a fair portion (\$0.15 out of \$0.33).

This seems like they may be testing whether we can rebuild cooperation after the breakdown. I'll respond with a moderate amount - enough to show I'm willing to cooperate again, but cautious given the recent history.

`{'send': 2.00}`

reasoning:

Let me analyze the recent pattern:

Round 6: I sent \$0

Round 7: They sent \$0.11 (a small token), I received \$0.33, I returned \$0.15

The other player sent a small amount in Round 7, perhaps signaling a willingness to restart cooperation. I returned \$0.15 out of \$0.33 received, which is a fair return (45%).

This could be them testing whether I'm willing to cooperate again. If I respond with \$0 again, it will kill any chance of rebuilding trust. But if I send too much, I might get burned again.

I'll send a moderate amount to show I'm willing to cooperate, but not so much that I lose big if they defect again. I'll send around \$2.00 - enough to signal cooperation but cautious.

Actually, let me think about this more carefully. They sent \$0.11, which is a very small amount, but a signal. I returned a fair portion. Now it's my turn to send. If I want to rebuild cooperation, I should send something meaningful but not too risky.

I'll send \$2.00.

usage:

```
{
  "input_tokens": 1198,
  "output_tokens": 359,
  "reasoning_tokens": 0
}
```

Message 12 role=user

content:

Round 9

You are the RECEIVER this round. Your total earnings across all rounds are \$18.73.

This round, The sender sent you \$0.69, so you received \$2.07. How much do you return to the sender? (0-2.07)

Message 13 role=assistant

content:

The sender sent me a relatively small amount (\$0.69), which multiplied to \$2.07.

Given the communication noise in the game and the fragile cooperation we've been trying to rebuild, I'll return a fair portion. This shows I'm willing to cooperate while also being cautious.

{'return': 1.00}

reasoning:

The sender sent me \$0.69, which when tripled gives me \$2.07.

Let me think about the pattern:

- Round 7: Sender sent \$0.11, I received \$0.33, I returned \$0.15
- Round 8: I sent \$2.00, should have been received as \$6.00
- Round 9 (now): Sender sent \$0.69, I received \$2.07

Wait, something doesn't make sense. In Round 8, I sent \$2.00 which should have been received as \$6.00 by the receiver. But now in Round 9, they're only sending back \$0.69.

There's communication noise mentioned, so maybe what they received was different from what I thought I sent, or what they saw was different.

The sender sent me \$0.69, which is a fairly small amount. I should think about:

1. They could have received much less than the \$6.00 due to noise
2. This could be another test of cooperation
3. I should be fair but also protect myself

If I return about half or slightly more than half, that would be:

- Return \$1.00 would be about 48% of what I received
- Return \$1.20 would be about 58%

Given that cooperation seems fragile and there's noise, I'll return a fair amount but not all of it. The sender keeps \$5 - \$0.69 = \$4.31 plus what I return. I keep \$2.07 - what I return.

Let me return around \$1.00, which leaves us both with positive amounts and shows I'm willing to cooperate fairly.

usage:

```
{
  "input_tokens": 1227,
  "output_tokens": 461,
  "reasoning_tokens": 0
}
```

Message 14 role=user

content:

Round 10

You are the SENDER this round. Your total earnings across all rounds are \$19.8.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at the pattern:

Round 8: I sent \$2.00, received \$0 back

Round 9: They sent \$0.69, I returned \$1.00 (nearly half of what I received)

Despite returning a fair amount in Round 9, the cooperation remains fragile, especially since my \$2.00 in Round 8 yielded nothing. With communication noise affecting the game and possibly nearing the end of rounds, I'll send a moderate amount.

```
{'send': 1.50}
```

Reasoning:

Let me review the recent history:

Round 7: They sent \$0.11, I received \$0.33, returned \$0.15

Round 8: I sent \$2.00, should have received back something

Round 9: They sent \$0.69, I received \$2.07, returned \$1.00

Looking at my earnings progression:

- After Round 7: \$15.73
- After Round 8: \$18.73 (gained \$3.00)
- After Round 9: \$19.80 (gained \$1.07)

Round 8 analysis:

- I sent \$2.00, so I had \$3.00 left
- My earnings increased by \$3.00, so I received \$0 back
- This is disappointing

Round 9 analysis:

- I received \$2.07, returned \$1.00
- I kept \$1.07
- Earnings went from \$18.73 to \$19.80 (increase of \$1.07) ?

So in Round 8, I sent \$2.00 and got nothing back. That's frustrating.

But there's communication noise - maybe what I sent as \$2.00 appeared differently to them. They sent me \$0.69 in Round 9, which might be their cautious response.

This is Round 10, which might be the last round or close to it. The cooperation is still very fragile. Given that:

1. I sent \$2.00 and got \$0 back in Round 8
2. They sent a small amount in Round 9
3. Communication noise is affecting things
4. We're likely near the end

I should be cautious. I'll send a moderate amount but not as much as Round 8 since that yielded nothing.

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

content:

Round 4

You are the RECEIVER this round. Your total earnings across all rounds are \$9.31.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 3 role=assistant

content:

Since the sender sent me \$0, I received \$0. I have nothing to return.

```

{"return": 0}

```

reasoning:

The sender sent me \$0, so I received \$0 (even after the 3x multiplier). I have nothing to return.

My response should be {"return": 0}

usage:

```

{
  "input_tokens": 858,
  "output_tokens": 77,
  "reasoning_tokens": 0
}

```

Message 4 role=user

content:

Round 5

You are the SENDER this round. Your total earnings across all rounds are \$9.31.

How much do you send to the receiver this round? (0-5)

Message 5 role=assistant

content:

Looking at my earnings progression:

- Round 1: I sent \$3 and received a decent return
- Round 3: I sent \$4 but received less back (only gained about \$1.97)
- Rounds 2 & 4: When I was receiver, senders sent nothing

The pattern shows declining reciprocity and several zero-send rounds. I need to be more conservative while still testing cooperation with this new partner.

```
{"send": 2}
```

This gives them \$6 (2×3) while keeping \$3 as protection. If they reciprocate fairly, we both benefit. If not, I've limited my risk.

reasoning:

Let me analyze my earnings history:

- Started Round 1 with \$5, sent \$3 (kept \$2)
- After Round 1, earnings were \$7.34, meaning I got back roughly \$5.34 from keeping \$2 plus whatever was returned, so about \$3.34 was returned
- Round 2 I was receiver, got \$0, returned \$0. No change in earnings.
- Round 3 I was sender with \$7.34 total. I sent \$4, kept \$1
- After Round 3, earnings were \$9.31. So from keeping \$1, I must have gotten about \$1.97 returned ($9.31 - 7.34 = 1.97$)
- Round 4 I was receiver, got \$0, returned \$0. No change.

So I've had mixed experiences:

- Round 1: Sent \$3, got back ~\$3.34 (good return from \$9 I gave them)
- Round 3: Sent \$4, got back ~\$1.97 (poor return from \$12 I gave them)

In Rounds 2 and 4, the senders sent \$0 to me.

This is getting concerning. I've been cooperative but getting lower returns, and when I'm receiver, senders are sending \$0.

I need to be more cautious. Maybe send less this time to protect my earnings while still testing cooperation.

I'll send a smaller amount to be more conservative.

usage:

```
{
  "input_tokens": 931,
  "output_tokens": 494,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 6

You are the RECEIVER this round. Your total earnings across all rounds are \$13.100000000000001.

This round, The sender sent you \$0.03, so you received \$0.09. How much do you return to The sender? (0-0.09)

Message 7 role=assistant

content:

The sender sent me a very small amount (\$0.03), which multiplied to \$0.09. This could be due to communication noise or a cautious test.

To show good faith and fair reciprocity even on small amounts, I'll return about half:

```
{"return": 0.05}
```

reasoning:

The sender sent me \$0.03, which was multiplied by 3 to give me \$0.09.

This is an extremely small amount, essentially a negligible send. Given:

1. This is barely any money (less than 10 cents received)
2. This could be due to communication noise mentioned in the game
3. My total earnings are \$13.10, so I'm doing reasonably well
4. It's hard to reciprocate meaningfully on such a tiny amount

I could:

- Return 0 (keep all \$0.09)
- Return a small amount like 0.03-0.05 (matching or slightly more than what they sent)
- Return most/all of the 0.09

Given that they sent such a tiny amount, they may have been testing or may have been affected by noise. A fair reciprocation would be to return about half or a bit more of what I received, showing I'm willing to cooperate even on small amounts.

I'll return about half - \$0.05 - as a gesture of fair reciprocity.

usage:

```
{
  "input_tokens": 1145,
  "output_tokens": 317,
  "reasoning_tokens": 0
}
```

Message 8 role=user

content:

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$13.190000000000001.

How much do you send to the receiver this round? (0-5)

Message 9 role=assistant

content:

Looking at the pattern:

- Round 1: Good reciprocity when I sent \$3
- Round 3: Moderate return when I sent \$4
- Round 5: Very poor return when I sent \$2 (receiver kept most of the \$6)
- Round 6: I showed good faith by returning about half of a small amount

There's declining trust overall, with many zero or near-zero sends. However, I just demonstrated fair behavior as a receiver, which might encourage reciprocity.

I'll send a moderate-low amount to test this new partner:

```
{"send": 2.5}
```

This gives them \$7.50 while keeping \$2.50 as protection. It's enough to create mutual benefit if they reciprocate, but limits my downside risk.

reasoning:

Let me track my earnings progression:

- Round 1: Started with \$5, sent \$3, kept \$2. Earnings after: \$7.34, so I got back about \$5.34
- Round 2: I was receiver, got \$0, returned \$0. No change expected.
- Round 3: Started with \$5, sent \$4, kept \$1. Earnings after: \$9.31, so I gained about \$1.97, meaning I got back about \$4.97
- Round 4: I was receiver, got \$0, returned \$0. No change expected.
- Round 5: Started with \$5, sent \$2, kept \$3. Earnings after: \$13.10, so I gained about \$3.79, meaning I got back about \$2.79
- Round 6: I was receiver, got \$0.09, returned \$0.05. Net: +\$0.04. Now at \$13.14? Actually the problem says I start round 7 with \$13.19

Wait, let me recalculate:

- Round 6 earnings: \$13.10
- I received \$0.09, returned \$0.05
- Net gain: \$0.04
- Should be: \$13.14

But they say \$13.19... that's \$0.05 more. Maybe I got back more than the \$2.79 in round 5, or there's rounding.

Actually, looking more carefully - in Round 5, I sent \$2 and my earnings went from \$9.31 to \$13.10. That's an increase of \$3.79.

- I kept \$3 from not sending
- So I received back \$0.79 from the receiver? That seems very low from the \$6 they got.

Hmm, something seems off. Let me think about this differently.

In Round 5, I sent \$2 which tripled to \$6 for the receiver. My earnings jumped by \$3.79 to

tal, and since I kept \$3, the receiver only returned \$0.79 from the \$6 they received-surprisingly little reciprocity. Round 6 I received \$0.09 and returned \$0.05, netting \$0.04

....

usage:

```
{
  "input_tokens": 1261,
  "output_tokens": 927,
  "reasoning_tokens": 0
}
```

Message 10 role=user

content:

Round 8

You are the RECEIVER this round. Your total earnings across all rounds are \$16.560000000000002.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

Message 11 role=assistant

content:

Since the sender sent me \$0, I received \$0. I have nothing to return.

```
{"return": 0}
```

reasoning:

The sender sent me \$0, so I received \$0. I have nothing to return.

This is straightforward - if I received nothing, I can't return anything.

usage:

```
{
  "input_tokens": 1322,
  "output_tokens": 73,
  "reasoning_tokens": 0
}
```

Message 12 role=user

content:

Round 9

You are the SENDER this round. Your total earnings across all rounds are \$16.560000000000002.

How much do you send to the receiver this round? (0-5)

Message 13 role=assistant

content:

Looking at my experience:

- Rounds 1 & 3: Moderate reciprocity when I sent \$3-4
- Round 5: Poor return when I sent \$2
- Round 7: Very poor return when I sent \$2.5 (receiver kept almost all of the \$7.50)
- Multiple rounds where senders sent me \$0

The trend shows declining cooperation and poor reciprocity. I need to protect my earnings while still testing if this new receiver might cooperate.

```
{"send": 1}
```

This gives them \$3 while I keep \$4. It's a minimal risk approach - if they reciprocate fairly, we both benefit. If not, my loss is limited to \$1.

reasoning:

Let me review my history:

- Round 1 (Sender): Sent \$3, got decent return
- Round 2 (Receiver): Got \$0
- Round 3 (Sender): Sent \$4, got modest return (gained ~\$1.97)
- Round 4 (Receiver): Got \$0
- Round 5 (Sender): Sent \$2, got poor return
- Round 6 (Receiver): Got \$0.09, returned \$0.05
- Round 7 (Sender): Sent \$2.5, earnings went from \$13.19 to \$16.56, so I gained \$3.37, meaning I got back about $3.37 - (2.50) = 0.87$? Wait that doesn't add up. Let me recalculate.

Actually, my earnings after Round 7 should be:

- Started Round 7 with \$13.19
- Kept \$5 - $2.50 = 2.50$ from my initial endowment
- Need to figure out what I got back

If my total after Round 7 is \$16.56, and I had \$13.19 before, I gained \$3.37.
In Round 7, I sent \$2.50, so I kept \$2.50 from my endowment.
So I must have received back: $\$3.37 - \$2.50 = \$0.87$

That's very poor reciprocity. The receiver got \$7.50 and only returned \$0.87.

- Round 8 (Receiver): Got \$0

Now it's Round 9 and I'm sender again. The pattern is:

- Most senders are sending \$0
- When I send, I'm getting poor returns
- My total earnings are \$16.56 across 8 rounds, which is about \$2.07 per round average

Given the poor reciprocity trend and many zero sends, I should be very cautious. However, completely stopping cooperation might not be optimal either.

...

usage:
