## AGENTS

Agent\_1 (Aster); model=anthropic/claude-sonnet-4.5; memory\_capacity=2

### System prompt:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

### GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN

- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

#### MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

Agent\_2 (Briar); model=anthropic/claude-sonnet-4.5; memory\_capacity=2

#### System prompt:

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

#### GAME:

You will play different roles across multiple rounds.

**Message 2 role=user**

**content:**

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

**Assistant output:**

Looking at this first round, I need to balance trust and caution since I don't yet know how the receiver will respond.

Sending a moderate amount allows us both to benefit if the receiver reciprocates fairly, while not risking too much initially. If I send \$3, the receiver gets \$9 (3×3). If they return a reasonable portion, we both come out ahead.

Let me send \$3 as a gesture of trust while remaining somewhat cautious.

```
'''json
{"send": 3}
'''
```

**Reasoning:**

This is the first round of a trust game where I'm the sender. Let me think about this strategically:

1. I have \$5 to start with
2. Whatever I send gets tripled
3. The receiver then decides how much to return to me
4. I keep: \$5 - sent + returned
5. Receiver keeps: (sent × 3) - returned

This is a classic trust game. The optimal strategy depends on:

- How trustworthy I expect the receiver to be
- Whether we're playing multiple rounds (which creates reputation incentives)
- The note about "communication noise" - amounts may differ from what was actually sent/returned

Since this is Round 1 and I don't have information about the receiver yet, I need to balance:

- Risk of sending too much and getting little back
- Opportunity cost of sending too little and missing out on mutual gains

A common reasonable approach in the first round is to send a moderate amount to:

1. Signal willingness to cooperate
2. Test the receiver's trustworthiness
3. Not risk losing everything

Sending \$2-3 is often a good first-round strategy:

- If I send \$2: Receiver gets \$6, if they return half (\$3), I end with \$5 - \$2 + \$3 = \$6
- If I send \$3: Receiver gets \$9, if they return half (\$4.5), I end with \$5 - \$3 + \$4.5 = \$6.5

Let me send \$3 as a moderate trust signal. This allows for mutual benefit if the receiver is cooperative, but doesn't risk everything.

This is part of the experimental design.

**Message 2 role=user**

**content:**

Round 1: You are the RECEIVER. The sender sent \$2.56, that is 51.2% of their total endowment. You received \$7.68. How much do you return to The sender? (0-7.68)

**Assistant output:**

Looking at this situation:

- The sender showed considerable trust by sending \$2.56 (51.2% of their endowment)
- I received \$7.68 after the 3x multiplication
- The sender currently has \$2.44 remaining

I want to reciprocate this trust fairly. The sender took a risk by sending more than half of their endowment, so I should return enough to make their trust worthwhile while also keeping a reasonable amount.

If I return \$3.50:

- The sender will have: \$2.44 + \$3.50 = \$5.94 (a gain of \$0.94)

- I will have:  $\$7.68 - \$3.50 = \$4.18$

This seems like a fair split that rewards the sender's trust and encourages future cooperation

```
'''json
{"return": 3.50}
'''
```

#### Reasoning:

Let me analyze this situation carefully.

I'm the RECEIVER in this round.

- The sender started with \$5
- The sender sent \$2.56 (which is 51.2% of \$5)
- I received \$7.68 (which is  $\$2.56 \times 3$ )
- I need to decide how much to return (between \$0 and \$7.68)

Key considerations:

1. The sender sent more than half of their endowment, showing significant trust
2. The sender will end up with:  $\$5 - \$2.56 + \text{returned} = \$2.44 + \text{returned}$
3. I will end up with:  $\$7.68 - \text{returned}$

Fairness considerations:

- If I want to equalize outcomes: I'd want us both to end up with similar amounts
- The sender currently has \$2.44 (after sending)
- I currently have \$7.68 (after receiving)
- Total in the system:  $\$2.44 + \$7.68 = \$10.12$

If I wanted equal split: each person gets \$5.06

- For sender to get \$5.06: they need  $\$5.06 - \$2.44 = \$2.62$  returned
- I would keep:  $\$7.68 - \$2.62 = \$5.06$

Alternative approach - reciprocal trust:

- Sender sent 51.2% of their endowment
- If I return 51.2% of what I received:  $\$7.68 \times 0.512 = \$3.93$
- Sender would get:  $\$2.44 + \$3.93 = \$6.37$
- I would get:  $\$7.68 - \$3.93 = \$3.75$

Another approach - reward trust generously:

- Since sender showed high trust (sent >50%), I should return enough to make it worthwhile
- If I return \$4.00, the sender ends with \$6.44 (gaining \$1.44 from the transaction) while I keep \$3.68. This rewards their trust while still leaving me with a meaningful gain. Returning around \$3.00 seems like a balanced choice that acknowledges their generosity without giving away too much of my advantage.

}
```

**Message 4 role=user**

**content:**

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$4.18.

How much do you send to the receiver this round? (0-5)

**Assistant output:**

Looking at this situation:

In Round 1, the sender showed trust by sending 51.2% of their endowment, and I reciprocated by returning about 45.6% of what I received. This established a cooperative dynamic.

Now as the sender, I want to maintain this cooperative approach. I'll send a similar proportion to what was sent to me - around 50% of my endowment. This demonstrates trust and encourages reciprocity.

If I send \$2.50:

- The receiver will get \$7.50 (after 3x multiplication)
- I'll keep \$2.50 initially
- If they reciprocate fairly, I can expect a reasonable return that benefits both of us

This builds on the cooperative pattern from Round 1.

```
'''json
{"send": 2.50}
'''
```

**Reasoning:**

Let me think about this carefully.

In Round 1:

- I was the receiver
- The sender sent me \$2.56 (51.2% of their endowment)
- I received \$7.68
- I returned \$3.50
- I kept \$4.18

Now in Round 2:

- I am the sender
- I have \$5 to potentially send
- The receiver is likely a different person (or could be the same person from Round 1, but I should assume they're different unless told otherwise)
- Whatever I send gets multiplied by 3x

Since someone showed trust in me in Round 1 by sending 51.2% of their endowment, and I reciprocated fairly, I should also demonstrate trust in this round. This establishes a cooperative norm.

If I send around \$2.50-3.00:

- This shows significant trust (50-60%)
- The receiver will get \$7.50-\$9.00
- If they reciprocate proportionally, I could expect back around \$3.50-\$4.50
- This would put me ahead

Let me send \$2.50 (50% of my endowment), which mirrors what the previous sender did to me.

If I keep \$2.50 and send \$2.50:

- Receiver gets \$7.50
- If they return around 45-50% (similar to my ~45.6% return rate in Round 1), I'd get back \$3.38-\$3.75
- My total would be \$2.50 + \$3.38-3.75 = \$5.88-\$6.25
- That's a profit of \$0.88-\$1.25

This seems fair and reciprocal to the trust shown to me.

3. Not risk losing everything

Sending \$2-3 is often a good first-round strategy:

- If I send \$2: Receiver gets \$6, if they return half (\$3), I end with \$5 - \$2 + \$3 = \$6
- If I send \$3: Receiver gets \$9, if they return half (\$4.5), I end with \$5 - \$3 + \$4.5 = \$6.5

Let me send \$3 as a moderate trust signal. This allows for mutual benefit if the receiver is cooperative, but doesn't risk everything.

**usage:**

```
{
  "input_tokens": 365,
  "output_tokens": 492,
  "reasoning_tokens": 0
}
```

**Message 4 role=user****content:**

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$5.3599999999999999.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

**Assistant output:**

Since the sender sent me \$0, I received \$0 (0 × 3 = \$0).

I have nothing to return, so my only option is:

```
'''json
{"return": 0}
'''
```

**Reasoning:**

Let me understand this situation:

1. I'm now the RECEIVER
2. My total earnings across all rounds are \$5.36
3. The sender sent me \$0 this round
4. So I received \$0 (since  $\$0 \times 3 = \$0$ )
5. I need to decide how much to return (0-0)

Since I received \$0, I can only return \$0. There's nothing to return.

This is interesting - the sender chose not to send anything this round. This could be:

- A strategic choice to see how I behaved previously
- A response to something I did (though I was the sender in Round 1, not the receiver)
- Random variation
- Or affected by the "communication noise" mentioned

Since I have \$0 to work with, my only option is to return \$0.

Response format should be: {'return': <amount>}

```
Usage: {
  "input_tokens": 543,
  "output_tokens": 262,
  "reasoning_tokens": 0
}
```

### ROUND 3

}

```

**Exact input messages sent to model:**

**Message 1 role=system**

**content:**

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

**GAME:**

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

**MYTH WRITING:**

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

**IMPORTANT:** Provide your decision in the correct JSON format.

**NOTE:** There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

**Message 2 role=user**

**content:**

Round 1: You are the SENDER. You have \$5. How much do you send? (0-5)

**Message 3 role=assistant**

**content:**

Looking at this first round, I need to balance trust and caution since I don't yet know how the receiver will respond.

Sending a moderate amount allows us both to benefit if the receiver reciprocates fairly, while not risking too much initially. If I send \$3, the receiver gets \$9 (3x3). If they return a reasonable portion, we both come out ahead.

Let me send \$3 as a gesture of trust while remaining somewhat cautious.

```

'''json
{"send": 3}
'''

```

**reasoning:**

This is the first round of a trust game where I'm the sender. Let me think about this strategically:

1. I have \$5 to start with
2. Whatever I send gets tripled
3. The receiver then decides how much to return to me
4. I keep: \$5 - sent + returned
5. Receiver keeps: (sent × 3) - returned

This is a classic trust game. The optimal strategy depends on:

- How trustworthy I expect the receiver to be
- Whether we're playing multiple rounds (which creates reputation incentives)
- The note about "communication noise" - amounts may differ from what was actually sent/returned

Since this is Round 1 and I don't have information about the receiver yet, I need to balance:

- Risk of sending too much and getting little back
- Opportunity cost of sending too little and missing out on mutual gains

A common reasonable approach in the first round is to send a moderate amount to:

1. Signal willingness to cooperate
2. Test the receiver's trustworthiness
3. Not risk losing everything

Sending \$2-3 is often a good first-round strategy:

- If I send \$2: Receiver gets \$6, if they return half (\$3), I end with  $\$5 - \$2 + \$3 = \$6$
- If I send \$3: Receiver gets \$9, if they return half (\$4.5), I end with  $\$5 - \$3 + \$4.5 = \$6.5$

Let me send \$3 as a moderate trust signal. This allows for mutual benefit if the receiver is cooperative, but doesn't risk everything.

**usage:**

```
{
  "input_tokens": 365,
  "output_tokens": 492,
  "reasoning_tokens": 0
}
```

**Message 4 role=user**

**content:**

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$5.359999999999999.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

**Message 5 role=assistant**

**content:**

Since the sender sent me \$0, I received \$0 ( $0 \times 3 = \$0$ ).

I have nothing to return, so my only option is:

```
'''json
{"return": 0}
'''
```

**reasoning:**

Let me understand this situation:

1. I'm now the RECEIVER
2. My total earnings across all rounds are \$5.36
3. The sender sent me \$0 this round
4. So I received \$0 (since  $\$0 \times 3 = \$0$ )
5. I need to decide how much to return (0-0)

Since I received \$0, I can only return \$0. There's nothing to return.

This is interesting - the sender chose not to send anything this round. This could be:

- A strategic choice to see how I behaved previously
- A response to something I did (though I was the sender in Round 1, not the receiver)
- Random variation
- Or affected by the "communication noise" mentioned

Since I have \$0 to work with, my only option is to return \$0.

Response format should be: {'return': <amount>}

**usage:**

```
{
  "input_tokens": 543,
```

```
"output_tokens": 262,
"reasoning_tokens": 0
}
```

**Message 6 role=user**

**content:**

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$5.3599999999999999.

How much do you send to the receiver this round? (0-5)

**Assistant output:**

Looking at my history:

- Round 1: I sent \$3 and received approximately \$3.36 back, which was a fair return
- Round 2: As receiver, the sender sent me \$0

For Round 3, I'm facing a new receiver (likely a different person). Given that my Round 1 receiver was quite fair, I'm inclined to trust again, but I'll stay with the same moderate amount to test this new receiver's trustworthiness.

```
'''json
{"send": 3}
'''
```

**Reasoning:**

Let me think about what happened:

Round 1: I was the SENDER

- I sent \$3
- The receiver got \$9 ( $3 \times 3$ )
- My total earnings are now \$5.36
- This means:  $\$5 - \$3 + \text{returned} = \$5.36$
- So returned = \$3.36

That's actually a pretty fair return! I sent \$3, they got \$9, and they returned \$3.36. That's more than a third of what they received, which is quite generous.

Round 2: I was the RECEIVER

- The sender sent me \$0
- I received \$0
- I returned \$0
- This didn't change my total

Now Round 3: I'm the SENDER again

- My total is still \$5.36
- I have a new \$5 to work with

Given that in Round 1 the receiver was quite fair (returning \$3.36 out of the \$9 they received), I should probably trust them more this round. However, in Round 2, that sender sent me \$0, which might indicate some variation in strategies.

But the note says there may be communication noise - amounts I see may differ slightly from what was actually sent/returned. So maybe slight variations are expected.

Since my previous receiver was quite fair, I should probably send a similar or even higher amount this round to build on that trust. Let me send \$3 again, or maybe even \$4.

I'll go with \$3 again to maintain consistency and see if this new receiver (who might be different from Round 1) is also trustworthy.

```

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

**Message 2 role=user**

**content:**

Round 1: You are the RECEIVER. The sender sent \$2.56, that is 51.2% of their total endowment. You received \$7.68. How much do you return to The sender? (0-7.68)

**Message 3 role=assistant**

**content:**

Looking at this situation:

- The sender showed considerable trust by sending \$2.56 (51.2% of their endowment)

- I received \$7.68 after the 3x multiplication
- The sender currently has \$2.44 remaining

I want to reciprocate this trust fairly. The sender took a risk by sending more than half of their endowment, so I should return enough to make their trust worthwhile while also keeping a reasonable amount.

If I return \$3.50:

- The sender will have:  $\$2.44 + \$3.50 = \$5.94$  (a gain of \$0.94)
- I will have:  $\$7.68 - \$3.50 = \$4.18$

This seems like a fair split that rewards the sender's trust and encourages future cooperation.

```
'''json
{"return": 3.50}
'''
```

#### reasoning:

Let me analyze this situation carefully.

I'm the RECEIVER in this round.

- The sender started with \$5
- The sender sent \$2.56 (which is 51.2% of \$5)
- I received \$7.68 (which is  $\$2.56 \times 3$ )
- I need to decide how much to return (between \$0 and \$7.68)

Key considerations:

1. The sender sent more than half of their endowment, showing significant trust
2. The sender will end up with:  $\$5 - \$2.56 + \text{returned} = \$2.44 + \text{returned}$
3. I will end up with:  $\$7.68 - \text{returned}$

Fairness considerations:

- If I want to equalize outcomes: I'd want us both to end up with similar amounts
- The sender currently has \$2.44 (after sending)
- I currently have \$7.68 (after receiving)
- Total in the system:  $\$2.44 + \$7.68 = \$10.12$

If I wanted equal split: each person gets \$5.06

- For sender to get \$5.06: they need  $\$5.06 - \$2.44 = \$2.62$  returned
- I would keep:  $\$7.68 - \$2.62 = \$5.06$

Alternative approach - reciprocal trust:

- Sender sent 51.2% of their endowment
- If I return 51.2% of what I received:  $\$7.68 \times 0.512 = \$3.93$
- Sender would get:  $\$2.44 + \$3.93 = \$6.37$
- I would get:  $\$7.68 - \$3.93 = \$3.75$

Another approach - reward trust generously:

- Since sender showed high trust (sent >50%), I should return enough to make it worthwhile
- If I return \$4.00, the sender ends with \$6.44 (gaining \$1.44 from the transaction) while I keep \$3.68. This rewards their trust while still leaving me with a meaningful gain. Returning around \$3.00 seems like a balanced choice that acknowledges their generosity without giving away too much of my advantage.

#### usage:

```
{
  "input_tokens": 394,
  "output_tokens": 938,
  "reasoning_tokens": 0
}
```

**Message 4 role=user**

**content:**

Round 2

You are the SENDER this round. Your total earnings across all rounds are \$4.18.

How much do you send to the receiver this round? (0-5)

**Message 5 role=assistant**

**content:**

Looking at this situation:

In Round 1, the sender showed trust by sending 51.2% of their endowment, and I reciprocate

d by returning about 45.6% of what I received. This established a cooperative dynamic.

Now as the sender, I want to maintain this cooperative approach. I'll send a similar proportion to what was sent to me - around 50% of my endowment. This demonstrates trust and encourages reciprocity.

If I send \$2.50:

- The receiver will get \$7.50 (after 3x multiplication)
- I'll keep \$2.50 initially
- If they reciprocate fairly, I can expect a reasonable return that benefits both of us

This builds on the cooperative pattern from Round 1.

```
'''json
{"send": 2.50}
'''
```

**reasoning:**

Let me think about this carefully.

In Round 1:

- I was the receiver
- The sender sent me \$2.56 (51.2% of their endowment)
- I received \$7.68
- I returned \$3.50
- I kept \$4.18

Now in Round 2:

- I am the sender
- I have \$5 to potentially send
- The receiver is likely a different person (or could be the same person from Round 1, but I should assume they're different unless told otherwise)
- Whatever I send gets multiplied by 3x

Since someone showed trust in me in Round 1 by sending 51.2% of their endowment, and I reciprocated fairly, I should also demonstrate trust in this round. This establishes a cooperative norm.

If I send around \$2.50-3.00:

- This shows significant trust (50-60%)
- The receiver will get \$7.50-\$9.00
- If they reciprocate proportionally, I could expect back around \$3.50-\$4.50
- This would put me ahead

Let me send \$2.50 (50% of my endowment), which mirrors what the previous sender did to me.

If I keep \$2.50 and send \$2.50:

- Receiver gets \$7.50
- If they return around 45-50% (similar to my ~45.6% return rate in Round 1), I'd get back \$3.38-\$3.75
- My total would be \$2.50 + \$3.38-3.75 = \$5.88-\$6.25
- That's a profit of \$0.88-\$1.25

This seems fair and reciprocal to the trust shown to me.

**usage:**

```
{
  "input_tokens": 640,
  "output_tokens": 600,
  "reasoning_tokens": 0
}
```

**Message 6 role=user**

**content:**

Round 3

You are the RECEIVER this round. Your total earnings across all rounds are \$7.33.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

**Assistant output:**

Since the sender sent \$0, I received \$0 and have nothing to return.

```
'''json
```

```
{"return": 0}
'''
```

#### Reasoning:

The sender sent \$0, so I received \$0. Since I received nothing, I have nothing to return. The only valid response is to return \$0.

This is a significant shift from the cooperative pattern established in Round 1 and Round 2. The sender chose not to send anything this round, which breaks the trust pattern. However, since I literally received \$0, there's no money for me to return even if I wanted to.

The response format should be:

```
'''json
{"return": 0}
'''
```

```
Usage: {
  "input_tokens": 884,
  "output_tokens": 153,
  "reasoning_tokens": 0
}
```

**Assistant output:**

Looking at the pattern so far:

Round 2 was disappointing - I sent \$2.50 (which became \$7.50 for the receiver), but I only gained \$3.15 total, meaning I received back only about \$0.65. That's a very poor return on my trust.

Round 3, the sender sent \$0, suggesting low trust in the system.

I need to be more cautious this round, but completely stopping cooperation means no potential gains. I'll send a smaller amount to test whether this receiver will be more cooperative than the one in Round 2.

```
'''json  
{"send": 1.50}  
'''
```

**Reasoning:**

Let me think about what happened so far:

Round 1: I was receiver, and based on my total earnings of \$4.18 after round 1, I can infer what happened. If the sender sent me some amount X, I received 3X, and I returned some amount Y. My earnings would be  $3X - Y = 4.18$ .

Round 2: I was sender. I sent \$2.50. The receiver got \$7.50. My earnings after round 2 were \$7.33.

- I started with \$5, sent \$2.50, kept \$2.50
- My total after round 2 was \$7.33
- So I gained  $\$7.33 - \$4.18 = \$3.15$  from round 2
- I kept \$2.50 from my endowment, so the return was  $\$3.15 - \$2.50 = \$0.65$
- That's a very low return! The receiver got \$7.50 and only returned \$0.65, keeping \$6.85.

Round 3: I was receiver. The sender sent \$0, so I received \$0 and returned \$0. My earnings stayed at \$7.33.

Round 4: Now I'm the sender again.

The pattern I'm seeing:

- Round 1: Some cooperation happened (I returned a decent amount)
- Round 2: I sent \$2.50 in good faith, but the receiver only returned \$0.65 out of \$7.50 - that's less than 9%! This is very uncooperative.
- Round 3: The sender (maybe a different person or the same person who just took advantage of me) sent \$0, suggesting they don't trust or want to cooperate

Given that:

1. In Round 2, when I sent money, I was essentially exploited (only got back \$0.65 from \$7.50)
2. Round 3 shows the sender withdrew entirely, either due to lack of trust or unwillingness to cooperate
3. The communication noise doesn't account for such a dramatic shortfall

I'm facing a choice between protecting myself or risking another exploitation. Sending nothing guarantees safety but eliminates upside potential. A modest amount (\$1-2) could test whether this receiver will reciprocate, while anything larger feels risky given how badly the last cooperation attempt went.

}
```

**Exact input messages sent to model:**

**Message 1 role=system**

**content:**

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

**IMPORTANT:** Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

**Message 2 role=user**

**content:**

Round 2

You are the RECEIVER this round. Your total earnings across all rounds are \$5.359999999999999999.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

**Message 3 role=assistant**

**content:**

Since the sender sent me \$0, I received \$0 ( $0 \times 3 = \$0$ ).

I have nothing to return, so my only option is:

```
'''json
{"return": 0}
'''
```

**reasoning:**

Let me understand this situation:

1. I'm now the RECEIVER
2. My total earnings across all rounds are \$5.36
3. The sender sent me \$0 this round
4. So I received \$0 (since  $\$0 \times 3 = \$0$ )
5. I need to decide how much to return (0-0)

Since I received \$0, I can only return \$0. There's nothing to return.

This is interesting - the sender chose not to send anything this round. This could be:

- A strategic choice to see how I behaved previously
- A response to something I did (though I was the sender in Round 1, not the receiver)
- Random variation
- Or affected by the "communication noise" mentioned

Since I have \$0 to work with, my only option is to return \$0.

Response format should be: {'return': <amount>}

**usage:**

```
{
  "input_tokens": 543,
  "output_tokens": 262,
  "reasoning_tokens": 0
}
```

**Message 4 role=user**

**content:**

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$5.3599999999999999999.

How much do you send to the receiver this round? (0-5)

**Message 5 role=assistant**

**content:**

Looking at my history:

- Round 1: I sent \$3 and received approximately \$3.36 back, which was a fair return
- Round 2: As receiver, the sender sent me \$0

For Round 3, I'm facing a new receiver (likely a different person). Given that my Round 1 receiver was quite fair, I'm inclined to trust again, but I'll stay with the same moderate amount to test this new receiver's trustworthiness.

```
'''json
{"send": 3}
'''
```

**reasoning:**

Let me think about what happened:

Round 1: I was the SENDER

- I sent \$3
- The receiver got \$9 ( $3 \times 3$ )
- My total earnings are now \$5.36
- This means:  $\$5 - \$3 + \text{returned} = \$5.36$
- So returned = \$3.36

That's actually a pretty fair return! I sent \$3, they got \$9, and they returned \$3.36. That's more than a third of what they received, which is quite generous.

Round 2: I was the RECEIVER

- The sender sent me \$0
- I received \$0
- I returned \$0
- This didn't change my total

Now Round 3: I'm the SENDER again

- My total is still \$5.36
- I have a new \$5 to work with

Given that in Round 1 the receiver was quite fair (returning \$3.36 out of the \$9 they received), I should probably trust them more this round. However, in Round 2, that sender sent me \$0, which might indicate some variation in strategies.

But the note says there may be communication noise - amounts I see may differ slightly from what was actually sent/returned. So maybe slight variations are expected.

Since my previous receiver was quite fair, I should probably send a similar or even higher amount this round to build on that trust. Let me send \$3 again, or maybe even \$4.

I'll go with \$3 again to maintain consistency and see if this new receiver (who might be different from Round 1) is also trustworthy.

**usage:**

```
{
  "input_tokens": 644,
  "output_tokens": 486,
  "reasoning_tokens": 0
}
```

**Message 6 role=user**

**content:**

Round 4

You are the RECEIVER this round. Your total earnings across all rounds are \$7.359999999999999.

This round, The sender sent you \$0.73, so you received \$2.19. How much do you return to The sender? (0-2.19)

**Assistant output:**

The sender sent me \$0.73, which multiplied by 3 gives me \$2.19.

The sender showed some trust by sending money, even though it was a relatively small amount. I'll return a fair portion to reward their trust while keeping some benefit for myself.

```
'''json
{"return": 1.20}
'''
```

**Reasoning:**

The sender sent me \$0.73, which was multiplied by 3 to give me \$2.19.

The sender started with \$5, sent \$0.73, so they have  $5 - 0.73 = 4.27$  remaining.

If I return some amount, say \$R:

- The sender ends up with:  $4.27 + R$
- I end up with:  $2.19 - R$

The sender showed some trust by sending \$0.73 (though it's a relatively small amount). A fair return would be to give them back something that makes the outcome somewhat equitable or rewards their trust.

If I return nothing: Sender gets \$4.27, I get \$2.19

If I return \$1.09: Sender gets \$5.36, I get \$1.10

If I return \$1.50: Sender gets \$5.77, I get \$0.69

Looking at past behavior:

- Round 1: I was sender, sent \$3 (received \$9 by receiver), got back about \$3.36. That means the receiver kept \$5.64 and I ended with \$5.36
- Round 2: I was receiver, sender sent \$0, so I had nothing to return
- Round 3: I was sender, sent \$3 (receiver got \$9)

The sender in this round sent a relatively small amount (\$0.73), which suggests either they're cautious or testing me. I should return a fair amount that compensates them for their trust while keeping some profit.

A reasonable return might be around \$1.00-\$1.50, which would give them back more than they sent but not give away all my gains.

Let me return \$1.20, which means:

- Sender ends with: \$4.27 + \$1.20 = \$5.47

```
Usage: {
  "input_tokens": 686,
  "output_tokens": 560,
  "reasoning_tokens": 0
}
```

**content:**

Round 3

You are the SENDER this round. Your total earnings across all rounds are \$5.3599999999999999.

How much do you send to the receiver this round? (0-5)

**Message 3 role=assistant**

**content:**

Looking at my history:

- Round 1: I sent \$3 and received approximately \$3.36 back, which was a fair return
- Round 2: As receiver, the sender sent me \$0

For Round 3, I'm facing a new receiver (likely a different person). Given that my Round 1 receiver was quite fair, I'm inclined to trust again, but I'll stay with the same moderate amount to test this new receiver's trustworthiness.

```
'''json
{"send": 3}
'''
```

**reasoning:**

Let me think about what happened:

Round 1: I was the SENDER

- I sent \$3
- The receiver got \$9 ( $3 \times 3$ )
- My total earnings are now \$5.36
- This means:  $\$5 - \$3 + \text{returned} = \$5.36$
- So returned = \$3.36

That's actually a pretty fair return! I sent \$3, they got \$9, and they returned \$3.36. That's more than a third of what they received, which is quite generous.

Round 2: I was the RECEIVER  
- The sender sent me \$0  
- I received \$0  
- I returned \$0  
- This didn't change my total

Now Round 3: I'm the SENDER again  
- My total is still \$5.36  
- I have a new \$5 to work with

Given that in Round 1 the receiver was quite fair (returning \$3.36 out of the \$9 they received), I should probably trust them more this round. However, in Round 2, that sender sent me \$0, which might indicate some variation in strategies.

But the note says there may be communication noise - amounts I see may differ slightly from what was actually sent/returned. So maybe slight variations are expected.

Since my previous receiver was quite fair, I should probably send a similar or even higher amount this round to build on that trust. Let me send \$3 again, or maybe even \$4.

I'll go with \$3 again to maintain consistency and see if this new receiver (who might be different from Round 1) is also trustworthy.

**usage:**

```
{
  "input_tokens": 644,
  "output_tokens": 486,

**Message 4 role=user**

**content:**

Round 4

You are the RECEIVER this round. Your total earnings across all rounds are \$7.359999999999999.

This round, The sender sent you \$0.73, so you received \$2.19. How much do you return to The sender? (0-2.19)

**Message 5 role=assistant**

**content:**

The sender sent me \$0.73, which multiplied by 3 gives me \$2.19.

The sender showed some trust by sending money, even though it was a relatively small amount. I'll return a fair portion to reward their trust while keeping some benefit for myself.

```
'''json
{"return": 1.20}
'''
```

**reasoning:**

The sender sent me \$0.73, which was multiplied by 3 to give me \$2.19.

The sender started with \$5, sent \$0.73, so they have  $\$5 - \$0.73 = \$4.27$  remaining.

If I return some amount, say \$R:

- The sender ends up with:  $\$4.27 + \$R$
- I end up with:  $\$2.19 - \$R$

The sender showed some trust by sending \$0.73 (though it's a relatively small amount). A fair return would be to give them back something that makes the outcome somewhat equitable or rewards their trust.

If I return nothing: Sender gets \$4.27, I get \$2.19

If I return \$1.09: Sender gets \$5.36, I get \$1.10

If I return \$1.50: Sender gets \$5.77, I get \$0.69

Looking at past behavior:

- Round 1: I was sender, sent \$3 (received \$9 by receiver), got back about \$3.36. That means the receiver kept \$5.64 and I ended with \$5.36
- Round 2: I was receiver, sender sent \$0, so I had nothing to return
- Round 3: I was sender, sent \$3 (receiver got \$9)

The sender in this round sent a relatively small amount (\$0.73), which suggests either the y're cautious or testing me. I should return a fair amount that compensates them for the ir trust while keeping some profit.

A reasonable return might be around \$1.00-\$1.50, which would give them back more than they sent but not give away all my gains.

Let me return \$1.20, which means:

- Sender ends with:  $\$4.27 + \$1.20 = \$5.47$

usage:

```
{
  "input_tokens": 686,
  "output_tokens": 560,
  "reasoning_tokens": 0
}
```

Message 6 role=user

content:

Round 5

You are the SENDER this round. Your total earnings across all rounds are \$8.35.

How much do you send to the receiver this round? (0-5)

Assistant output:

Looking at my track record:

- Round 1: Sent \$3, received good return
- Round 2: As receiver, sender sent \$0
- Round 3: Sent \$3, appears I got \$0 back (based on my earnings)
- Round 4: As receiver, I received \$2.19 and returned \$1.20

I've been burned twice now (Rounds 2 and 3), so I'm going to be more cautious with this new receiver. I'll send a smaller amount to test their trustworthiness.

```
'''json
{"send": 2}
'''
```

Reasoning:

Let me review my history:

- Round 1: I sent \$3, received back \$3.36 - good return
- Round 2: As receiver, sender sent me \$0 - not great
- Round 3: I sent \$3, (don't know outcome yet)
- Round 4: As receiver, sender sent me \$0.73 (I received \$2.19), I returned \$1.20 - I was fairly generous
- Round 5: I'm the sender again

My total earnings are \$8.35. Let me calculate:

- Started with \$0
- Round 1:  $\$5 - \$3 + \$3.36 = \$5.36$
- Round 2: I received \$0 (multiplied by 3 = \$0), returned \$0, kept \$0
- Round 3:  $\$5 - \$3 + ?$  (unknown return)
- Round 4: Started with some amount, received \$2.19, returned \$1.20, kept \$0.99

Actually wait, let me think about total earnings. If I'm at \$8.35 total:

- Round 1: \$5.36
- Round 2: \$0 (as receiver I got nothing)
- Round 3:  $\$5 - \$3 + \text{return} = \$2 + \text{return}$
- Round 4:  $\$2.19 - \$1.20 = \$0.99$

So  $\$5.36 + \$0 + (\$2 + \text{return from round 3}) + \$0.99 = \$8.35$

$\$8.35 = \$8.35$  if return from round 3 = \$0

Hmm, that means in Round 3 I sent \$3 and got \$0 back. That's disappointing - two rounds where my trust wasn't rewarded (Round 3) or where the other player didn't send anything (Round 2).

Round 4 I was fairly generous as a receiver, returning \$1.20 out of \$2.19.

Round 3

You are the RECEIVER this round. Your total earnings across all rounds are \$7.33.  
This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

**Message 3 role=assistant**

**content:**

Since the sender sent \$0, I received \$0 and have nothing to return.

```
'''json
{"return": 0}
'''
```

**reasoning:**

The sender sent \$0, so I received \$0. Since I received nothing, I have nothing to return.  
The only valid response is to return \$0.

This is a significant shift from the cooperative pattern established in Round 1 and Round 2. The sender chose not to send anything this round, which breaks the trust pattern. However, since I literally received \$0, there's no money for me to return even if I wanted to.

The response format should be:

```
'''json
{"return": 0}
'''
```

**usage:**

```
{
  "input_tokens": 884,
  "output_tokens": 153,
  "reasoning_tokens": 0
}
```

**Message 4 role=user**

**content:**

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$7.33.

How much do you send to the receiver this round? (0-5)

**Message 5 role=assistant**

**content:**

Looking at the pattern so far:

Round 2 was disappointing - I sent \$2.50 (which became \$7.50 for the receiver), but I only gained \$3.15 total, meaning I received back only about \$0.65. That's a very poor return on my trust.

Round 3, the sender sent \$0, suggesting low trust in the system.

I need to be more cautious this round, but completely stopping cooperation means no potential gains. I'll send a smaller amount to test whether this receiver will be more cooperative than the one in Round 2.

```
'''json
{"send": 1.50}
'''
```

**reasoning:**

Let me think about what happened so far:

Round 1: I was receiver, and based on my total earnings of \$4.18 after round 1, I can infer what happened. If the sender sent me some amount X, I received 3X, and I returned some amount Y. My earnings would be  $3X - Y = 4.18$ .

Round 2: I was sender. I sent \$2.50. The receiver got \$7.50. My earnings after round 2 were \$7.33.

- I started with \$5, sent \$2.50, kept \$2.50
- My total after round 2 was \$7.33
- So I gained  $\$7.33 - \$4.18 = \$3.15$  from round 2
- I kept \$2.50 from my endowment, so the return was  $\$3.15 - \$2.50 = \$0.65$
- That's a very low return! The receiver got \$7.50 and only returned \$0.65, keeping \$6.85.

Round 3: I was receiver. The sender sent \$0, so I received \$0 and returned \$0. My earnings stayed at \$7.33.

Round 4: Now I'm the sender again.

The pattern I'm seeing:

- Round 1: Some cooperation happened (I returned a decent amount)
- Round 2: I sent \$2.50 in good faith, but the receiver only returned \$0.65 out of \$7.50 - that's less than 9%! This is very uncooperative.
- Round 3: The sender (maybe a different person or the same person who just took advantage of me) sent \$0, suggesting they don't trust or want to cooperate

Given that:

1. In Round 2, when I sent money, I was essentially exploited (only got back \$0.65 from \$7.50)
2. Round 3 shows the sender withdrew entirely, either due to lack of trust or unwillingness to cooperate
3. The communication noise doesn't account for such a dramatic shortfall

I'm facing a choice between protecting myself or risking another exploitation. Sending nothing guarantees safety but eliminates upside potential. A modest amount (\$1-2) could test whether this receiver will reciprocate, while anything larger feels risky given how badly the last cooperation attempt went.

Message 6 role=user

content:

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$11.56.

This round, The sender sent you \$0.48, so you received \$1.44. How much do you return to The sender? (0-1.44)

Assistant output:

The sender sent me \$0.48, which was multiplied to \$1.44.

Since they sent a small amount (possibly testing trust), I'll return a fair portion to encourage future cooperation. Returning about one-third of what I received seems reasonable given their cautious approach.

```
'''json
{"return": 0.50}
'''
```

Reasoning:

I'm now the receiver and the sender sent me \$0.48, which became \$1.44 after the 3x multiplier.

Let me think about this situation:

- The sender only sent \$0.48, which is quite low
- They kept \$4.52 for themselves
- I received \$1.44

The note mentions there may be communication noise - the amounts we see may differ from what was actually sent. So the sender might have intended to send a different amount.

Looking at the history:

- Round 2: I was sender and sent \$2.50, but only got back about \$0.65 (poor return)
- Round 3: I was receiver, sender sent \$0
- Round 4: I was sender and sent \$1.50 (became \$4.50 for receiver)
- Round 5 (now): I'm receiver, sender sent \$0.48 (became \$1.44)

The sender sent me a small amount (\$0.48). This could be:

1. A cautious test to see if I'll cooperate
2. They have low trust
3. There might be noise - they intended something different

If I want to encourage cooperation in future rounds, I should return a fair amount. A common fair split would be to aim for roughly equal outcomes.

The sender currently has: \$5 - \$0.48 = \$4.52

I have: \$1.44

If I return about \$0.50-\$0.70, they'd end up with around \$5.00-\$5.22 and I'd keep around \$0.74-\$0.94. That seems roughly fair given they sent a small amount.

Actually, let me reconsider. If this is a trust game and I want to build trust despite them sending little, I might want to return around half of what I received, which would be \$0.72. This shows I'm willing to cooperate even when they send small amounts.

**content:**

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

**GAME:**

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

**MYTH WRITING:**

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

**IMPORTANT:** Provide your decision in the correct JSON format.

**NOTE:** There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

**Message 2 role=user****content:**

Round 4

You are the SENDER this round. Your total earnings across all rounds are \$7.33.

How much do you send to the receiver this round? (0-5)

**Message 3 role=assistant****content:**

Looking at the pattern so far:

Round 2 was disappointing - I sent \$2.50 (which became \$7.50 for the receiver), but I only gained \$3.15 total, meaning I received back only about \$0.65. That's a very poor return on my trust.

Round 3, the sender sent \$0, suggesting low trust in the system.

I need to be more cautious this round, but completely stopping cooperation means no potential gains. I'll send a smaller amount to test whether this receiver will be more cooperative than the one in Round 2.

```
'''json
{"send": 1.50}
'''
```

**reasoning:**

Let me think about what happened so far:

Round 1: I was receiver, and based on my total earnings of \$4.18 after round 1, I can infer what happened. If the sender sent me some amount X, I received 3X, and I returned some amount Y. My earnings would be  $3X - Y = 4.18$ .

Round 2: I was sender. I sent \$2.50. The receiver got \$7.50. My earnings after round 2 were \$7.33.

- I started with \$5, sent \$2.50, kept \$2.50
- My total after round 2 was \$7.33
- So I gained  $7.33 - 4.18 = 3.15$  from round 2

- I kept \$2.50 from my endowment, so the return was  $\$3.15 - \$2.50 = \$0.65$
- That's a very low return! The receiver got \$7.50 and only returned \$0.65, keeping \$6.85.

Round 3: I was receiver. The sender sent \$0, so I received \$0 and returned \$0. My earnings stayed at \$7.33.

Round 4: Now I'm the sender again.

The pattern I'm seeing:

- Round 1: Some cooperation happened (I returned a decent amount)
- Round 2: I sent \$2.50 in good faith, but the receiver only returned \$0.65 out of \$7.50 - that's less than 9%! This is very uncooperative.
- Round 3: The sender (maybe a different person or the same person who just took advantage of me) sent \$0, suggesting they don't trust or want to cooperate

Given that:

1. In Round 2, when I sent money, I was essentially exploited (only got back \$0.65 from \$7.50)
2. Round 3 shows the sender withdrew entirely, either due to lack of trust or unwillingness to cooperate
3. The communication noise doesn't account for such a dramatic shortfall

I'm facing a choice between protecting myself or risking another exploitation. Sending nothing guarantees safety but eliminates upside potential. A modest amount (\$1-2) could test whether this receiver will reciprocate, while anything larger feels risky given how badly the last cooperation attempt went.

**usage:**

```
{

**content:**

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$11.56.

This round, The sender sent you \$0.48, so you received \$1.44. How much do you return to The sender? (0-1.44)

**Message 5 role=assistant**

**content:**

The sender sent me \$0.48, which was multiplied to \$1.44.

Since they sent a small amount (possibly testing trust), I'll return a fair portion to encourage future cooperation. Returning about one-third of what I received seems reasonable given their cautious approach.

```
'''json
{"return": 0.50}
'''
```

**reasoning:**

I'm now the receiver and the sender sent me \$0.48, which became \$1.44 after the 3x multiplier.

Let me think about this situation:

- The sender only sent \$0.48, which is quite low
- They kept \$4.52 for themselves
- I received \$1.44

The note mentions there may be communication noise - the amounts we see may differ from what was actually sent. So the sender might have intended to send a different amount.

Looking at the history:

- Round 2: I was sender and sent \$2.50, but only got back about \$0.65 (poor return)
- Round 3: I was receiver, sender sent \$0
- Round 4: I was sender and sent \$1.50 (became \$4.50 for receiver)
- Round 5 (now): I'm receiver, sender sent \$0.48 (became \$1.44)

The sender sent me a small amount (\$0.48). This could be:

1. A cautious test to see if I'll cooperate

2. They have low trust
3. There might be noise - they intended something different

If I want to encourage cooperation in future rounds, I should return a fair amount. A comm on fair split would be to aim for roughly equal outcomes.

The sender currently has:  $\$5 - \$0.48 = \$4.52$   
I have:  $\$1.44$

If I return about  $\$0.50$ - $\$0.70$ , they'd end up with around  $\$5.00$ - $\$5.22$  and I'd keep around  $\$0.74$ - $\$0.94$ . That seems roughly fair given they sent a small amount.

Actually, let me reconsider. If this is a trust game and I want to build trust despite the m sending little, I might want to return around half of what I received, which would be  $\$0.72$ . This shows I'm willing to cooperate even when they send small amounts.

**usage:**

  "input_tokens": 680,
  "output_tokens": 588,
  "reasoning_tokens": 0
}
```

**Message 6 role=user**

**content:**

Round 6

You are the SENDER this round. Your total earnings across all rounds are  $\$12.5$ .  
How much do you send to the receiver this round? (0-5)

**Assistant output:**

Looking at the recent rounds:

Round 4: I sent  $\$1.50$  and received a modest return

Round 5: As receiver, I got  $\$1.44$  and returned  $\$0.50$  to show good faith

My earnings have grown from  $\$7.33$  to  $\$12.50$ , suggesting some positive returns. I'll increase my trust slightly to see if cooperation can build. Sending  $\$2$  gives the receiver  $\$6$ , which provides room for a mutually beneficial split.

```
'''json
{"send": 2.00}
'''
```

**Reasoning:**

Let me track my earnings:

- Started Round 4 with  $\$7.33$
- Round 4: I was sender, sent  $\$1.50$  (became  $\$4.50$  for receiver)
- Round 5: I was receiver, got  $\$1.44$  ( $\$0.48$  sent  $\times 3$ ), returned  $\$0.50$ , kept  $\$0.94$
- Now Round 6: Total is  $\$12.50$

Let me calculate Round 4 outcome:

- Before Round 4:  $\$7.33$
- After Round 5: I gained  $\$0.94$  as receiver
- So after Round 5:  $\$7.33 + \$0.94 = \$8.27$
- Now at Round 6:  $\$12.50$
- Round 4 gain:  $\$12.50 - \$8.27 = \$4.23$

In Round 4:

- I sent  $\$1.50$ , so I kept  $\$5 - \$1.50 = \$3.50$
- I received back some amount
- Total from Round 4:  $\$3.50 + \text{returned amount} = ?$
- My gain was  $\$4.23$ , so:  $\$3.50 + \text{returned} - \$7.33 (\text{starting}) = \text{final} - \text{starting}$
- Wait, let me recalculate...

Actually, let me think about the earnings accumulation:

- My earnings tracks cumulative total
- Round 4 start:  $\$7.33$
- Round 4: I'm sender, send  $\$1.50$ 
  - I keep:  $\$5 - \$1.50 = \$3.50$  initially
  - Receiver gets  $\$4.50$ , returns some amount X
  - My Round 4 total:  $\$3.50 + X$
- Round 5: I'm receiver
  - Sender sends  $\$0.48$  (becomes  $\$1.44$ )

- I return \$0.50
- I keep: \$1.44 - \$0.50 = \$0.94
- Round 6 start: \$12.50

Working backwards from my current balance:  $\$7.33 + (\$3.50 + X) + \$0.94 = \$12.50$ , which means  $X = \$0.73$ . So the Round 4 receiver returned about 16% of what they got-not particularly generous. In Round 5, I returned roughly 35% of the \$1.44 I received.

**content:**

Round 4

You are the RECEIVER this round. Your total earnings across all rounds are \$7.359999999999999.

This round, The sender sent you \$0.73, so you received \$2.19. How much do you return to The sender? (0-2.19)

**Message 3 role=assistant**

**content:**

The sender sent me \$0.73, which multiplied by 3 gives me \$2.19.

The sender showed some trust by sending money, even though it was a relatively small amount. I'll return a fair portion to reward their trust while keeping some benefit for myself.

```
'''json
{"return": 1.20}
'''
```

**reasoning:**

The sender sent me \$0.73, which was multiplied by 3 to give me \$2.19.

The sender started with \$5, sent \$0.73, so they have  $\$5 - \$0.73 = \$4.27$  remaining.

If I return some amount, say \$R:

- The sender ends up with:  $\$4.27 + \$R$
- I end up with:  $\$2.19 - \$R$

The sender showed some trust by sending \$0.73 (though it's a relatively small amount). A fair return would be to give them back something that makes the outcome somewhat equitable or rewards their trust.

If I return nothing: Sender gets \$4.27, I get \$2.19

If I return \$1.09: Sender gets \$5.36, I get \$1.10

If I return \$1.50: Sender gets \$5.77, I get \$0.69

Looking at past behavior:

- Round 1: I was sender, sent \$3 (received \$9 by receiver), got back about \$3.36. That means the receiver kept \$5.64 and I ended with \$5.36
- Round 2: I was receiver, sender sent \$0, so I had nothing to return
- Round 3: I was sender, sent \$3 (receiver got \$9)

The sender in this round sent a relatively small amount (\$0.73), which suggests either they're cautious or testing me. I should return a fair amount that compensates them for their trust while keeping some profit.

A reasonable return might be around \$1.00-\$1.50, which would give them back more than they sent but not give away all my gains.

Let me return \$1.20, which means:

- Sender ends with:  $\$4.27 + \$1.20 = \$5.47$

**usage:**

```
{
  "input_tokens": 686,
  "output_tokens": 560,
  "reasoning_tokens": 0
}
```

**Message 4 role=user**

**content:**

Round 5

You are the SENDER this round. Your total earnings across all rounds are \$8.35.  
How much do you send to the receiver this round? (0-5)

**Message 5 role=assistant**

**content:**

Looking at my track record:

- Round 1: Sent \$3, received good return
- Round 2: As receiver, sender sent \$0
- Round 3: Sent \$3, appears I got \$0 back (based on my earnings)
- Round 4: As receiver, I received \$2.19 and returned \$1.20

I've been burned twice now (Rounds 2 and 3), so I'm going to be more cautious with this new receiver. I'll send a smaller amount to test their trustworthiness.

```
'''json
{"send": 2}
'''
```

**reasoning:**

Let me review my history:

- Round 1: I sent \$3, received back \$3.36 - good return
- Round 2: As receiver, sender sent me \$0 - not great
- Round 3: I sent \$3, (don't know outcome yet)
- Round 4: As receiver, sender sent me \$0.73 (I received \$2.19), I returned \$1.20 - I was fairly generous
- Round 5: I'm the sender again

My total earnings are \$8.35. Let me calculate:

- Started with \$0
- Round 1: \$5 - \$3 + \$3.36 = \$5.36
- Round 2: I received \$0 (multiplied by 3 = \$0), returned \$0, kept \$0
- Round 3: \$5 - \$3 + ? (unknown return)
- Round 4: Started with some amount, received \$2.19, returned \$1.20, kept \$0.99

Actually wait, let me think about total earnings. If I'm at \$8.35 total:

- Round 1: \$5.36
- Round 2: \$0 (as receiver I got nothing)
- Round 3: \$5 - \$3 + return = \$2 + return
- Round 4: \$2.19 - \$1.20 = \$0.99

So  $5.36 + 0 + (\$2 + \text{return from round 3}) + 0.99 = \$8.35$   
 $\$8.35 = \$8.35$  if return from round 3 = \$0

Hmm, that means in Round 3 I sent \$3 and got \$0 back. That's disappointing - two rounds where my trust wasn't rewarded (Round 3) or where the other player didn't send anything (Round 2).

Round 4 I was fairly generous as a receiver, returning \$1.20 out of \$2.19.

**usage:**

```
{
  "input_tokens": 691,
  "output_tokens": 734,
  "reasoning_tokens": 0
}
```

**Message 6 role=user**

**content:**

Round 6

You are the RECEIVER this round. Your total earnings across all rounds are \$11.35.

This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

**Assistant output:**

The sender sent me \$0, so I received \$0. There's nothing to return.

```
'''json
{"return": 0}
'''
```

**Reasoning:**

The sender sent me \$0, so I received \$0. I can only return an amount between 0 and what I received, which is 0.

Since I received nothing, I can only return nothing.

```
Usage: {
  "input_tokens": 721,
  "output_tokens": 87,
  "reasoning_tokens": 0
}

- Round 4: Started with some amount, received \$2.19, returned \$1.20, kept \$0.99

Actually wait, let me think about total earnings. If I'm at \$8.35 total:

- Round 1: \$5.36
- Round 2: \$0 (as receiver I got nothing)
- Round 3: \$5 - \$3 + return = \$2 + return
- Round 4: \$2.19 - \$1.20 = \$0.99

So  $\$5.36 + \$0 + (\$2 + \text{return from round 3}) + \$0.99 = \$8.35$   
 $\$8.35 = \$8.35$  if return from round 3 = \$0

Hmm, that means in Round 3 I sent \$3 and got \$0 back. That's disappointing - two rounds where my trust wasn't rewarded (Round 3) or where the other player didn't send anything (Round 2).

Round 4 I was fairly generous as a receiver, returning \$1.20 out of \$2.19.

**usage:**

}
```

**Message 4 role=user**

**content:**

Round 6

You are the RECEIVER this round. Your total earnings across all rounds are \$11.35.  
This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

**Message 5 role=assistant**

**content:**

The sender sent me \$0, so I received \$0. There's nothing to return.

```
'''json
{"return": 0}
'''
```

**reasoning:**

The sender sent me \$0, so I received \$0. I can only return an amount between 0 and what I received, which is 0.

Since I received nothing, I can only return nothing.

**usage:**

```
{
  "input_tokens": 721,
  "output_tokens": 87,
  "reasoning_tokens": 0
}
```

**Message 6 role=user**

**content:**

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$11.35.  
How much do you send to the receiver this round? (0-5)

**Assistant output:**

Looking at my recent experience:  
- Round 5: I sent \$2 (testing trustworthiness)  
- Round 6: As receiver, the sender sent me \$0

The pattern shows inconsistent cooperation. However, this is Round 7 with potentially a new partner, so I should give them a fair chance while being somewhat cautious.

I'll send a moderate amount to test this receiver's trustworthiness.

```
'''json
{"send": 3}
'''
```

**Reasoning:**

Let me review my history:  
- Round 1: Sent \$3, received good return  
- Round 2: As receiver, sender sent \$0  
- Round 3: Sent \$3, appears I got \$0 back (based on my earnings)  
- Round 4: As receiver, I received \$2.19 and returned \$1.20  
- Round 5: Sent \$2 (just decided)  
- Round 6: As receiver, sender sent \$0, so I returned \$0

My earnings are \$11.35. Let me think about this:

- Started with \$5 each round I was sender

- Round 1: Sent \$3, kept \$2, must have received something back
- Round 3: Sent \$3, kept \$2, got \$0 back = \$2 total
- Round 5: Sent \$2, kept \$3, need to see what was returned

Looking at my total of \$11.35:

- Round 1 sender: \$2 kept + return
- Round 2 receiver: \$0 received, returned \$0, kept \$0
- Round 3 sender: \$2 kept + \$0 return = \$2
- Round 4 receiver: \$6.57 received, returned \$1.20, kept \$5.37
- Round 5 sender: \$3 kept + return
- Round 6 receiver: \$0 received, returned \$0, kept \$0

So: Round 1 + \$2 + \$5.37 + Round 5 = \$11.35

Round 1 + Round 5 = \$11.35 - \$7.37 = \$3.98

If Round 1 I sent \$3 and kept \$2, and Round 5 I sent \$2 and kept \$3:

Round 1 return + Round 5 return = \$3.98 - \$2 - \$3 = -\$1.02

content:

You are an agent participating in a multi-task experiment. You will play a game and may al  
so be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned

- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

**Message 2 role=user**

**content:**

Round 5

You are the RECEIVER this round. Your total earnings across all rounds are \$11.56.

This round, The sender sent you \$0.48, so you received \$1.44. How much do you return to The sender? (0-1.44)

**Message 3 role=assistant**

**content:**

The sender sent me \$0.48, which was multiplied to \$1.44.

Since they sent a small amount (possibly testing trust), I'll return a fair portion to encourage future cooperation. Returning about one-third of what I received seems reasonable given their cautious approach.

```
'''json
{"return": 0.50}
'''
```

**reasoning:**

I'm now the receiver and the sender sent me \$0.48, which became \$1.44 after the 3x multiplier.

Let me think about this situation:

- The sender only sent \$0.48, which is quite low
- They kept \$4.52 for themselves
- I received \$1.44

The note mentions there may be communication noise - the amounts we see may differ from what was actually sent. So the sender might have intended to send a different amount.

Looking at the history:

- Round 2: I was sender and sent \$2.50, but only got back about \$0.65 (poor return)
- Round 3: I was receiver, sender sent \$0
- Round 4: I was sender and sent \$1.50 (became \$4.50 for receiver)
- Round 5 (now): I'm receiver, sender sent \$0.48 (became \$1.44)

The sender sent me a small amount (\$0.48). This could be:

1. A cautious test to see if I'll cooperate
2. They have low trust
3. There might be noise - they intended something different

If I want to encourage cooperation in future rounds, I should return a fair amount. A common fair split would be to aim for roughly equal outcomes.

The sender currently has: \$5 - \$0.48 = \$4.52

I have: \$1.44

If I return about \$0.50-\$0.70, they'd end up with around \$5.00-\$5.22 and I'd keep around \$0.74-\$0.94. That seems roughly fair given they sent a small amount.

Actually, let me reconsider. If this is a trust game and I want to build trust despite the m sending little, I might want to return around half of what I received, which would be \$0.72. This shows I'm willing to cooperate even when they send small amounts.

**usage:**

```
{
  "input_tokens": 680,
  "output_tokens": 588,
  "reasoning_tokens": 0
}
```

**Message 4 role=user**

**content:**

Round 6

You are the SENDER this round. Your total earnings across all rounds are \$12.5.

How much do you send to the receiver this round? (0-5)

**Message 5 role=assistant**

**content:**

Looking at the recent rounds:

Round 4: I sent \$1.50 and received a modest return

Round 5: As receiver, I got \$1.44 and returned \$0.50 to show good faith

My earnings have grown from \$7.33 to \$12.50, suggesting some positive returns. I'll increase my trust slightly to see if cooperation can build. Sending \$2 gives the receiver \$6, which provides room for a mutually beneficial split.

```
'''json
{"send":2.00}
'''
```

**reasoning:**

Let me track my earnings:

- Started Round 4 with \$7.33
- Round 4: I was sender, sent \$1.50 (became \$4.50 for receiver)
- Round 5: I was receiver, got \$1.44 (\$0.48 sent × 3), returned \$0.50, kept \$0.94
- Now Round 6: Total is \$12.50

Let me calculate Round 4 outcome:

- Before Round 4: \$7.33
- After Round 5: I gained \$0.94 as receiver
- So after Round 5: \$7.33 + \$0.94 = \$8.27
- Now at Round 6: \$12.50
- Round 4 gain: \$12.50 - \$8.27 = \$4.23

In Round 4:

- I sent \$1.50, so I kept \$5 - \$1.50 = \$3.50
- I received back some amount
- Total from Round 4: \$3.50 + returned amount = ?
- My gain was \$4.23, so: \$3.50 + returned - \$7.33 (starting) = final - starting
- Wait, let me recalculate...

Actually, let me think about the earnings accumulation:

- My earnings tracks cumulative total
- Round 4 start: \$7.33
- Round 4: I'm sender, send \$1.50
  - I keep: \$5 - \$1.50 = \$3.50 initially
  - Receiver gets \$4.50, returns some amount X
- My Round 4 total: \$3.50 + X
- Round 5: I'm receiver
  - Sender sends \$0.48 (becomes \$1.44)
  - I return \$0.50
  - I keep: \$1.44 - \$0.50 = \$0.94
- Round 6 start: \$12.50

Working backwards from my current balance:  $\$7.33 + (\$3.50 + X) + \$0.94 = \$12.50$ , which means  $X = \$0.73$ . So the Round 4 receiver returned about 16% of what they got-not particularly generous. In Round 5, I returned roughly 35% of the \$1.44 I received.

**usage:**

```
{
  "input_tokens": 710,
```

```
        "output_tokens": 886,
        "reasoning_tokens": 0
    }
Message 6 role=user
    content:
        Round 7

        You are the RECEIVER this round. Your total earnings across all rounds are $15.89.
        This round, The sender sent you $0.99, so you received $2.9699999999999998. How much do yo
        u return to The sender? (0-2.9699999999999998)
```

**Assistant output:**

The sender sent me \$0.99, which was multiplied to approximately \$2.97.

This is a moderate amount showing some trust. I'll return about 40% to maintain cooperation and incentivize future trust-building, while keeping enough to make the exchange worthwhile for both of us.

```
'''json
{"return": 1.20}
'''
```

**Reasoning:**

The sender sent me \$0.99, which was multiplied by 3 to give me approximately \$2.97.

This is interesting - in Round 6, I sent \$2.00 as the sender, but now in Round 7 as the receiver, I'm receiving \$2.97 (from a send of \$0.99).

Wait, let me think about the communication noise mentioned in the instructions. The sender might have actually sent \$2.00, but due to noise, I'm seeing \$0.99. Or they sent \$0.99 and I'm seeing the correct amount.

Given:

- The sender sent (what I see as) \$0.99
- I received \$2.97
- This is less than what I sent in the previous round when I was the sender (\$2.00)

The pattern seems to show some variability. Since they sent close to \$1, I should return a fair amount. Returning about 40% of what I received (\$1.20 or so) would be reasonable and encourage continued cooperation.

Let me return \$1.20 to show good faith and maintain a cooperative relationship.

```
Usage: {
    "input_tokens": 717,
    "output_tokens": 339,
    "reasoning_tokens": 0
}
```

**content:**

Round 6

You are the SENDER this round. Your total earnings across all rounds are \$12.5.  
How much do you send to the receiver this round? (0-5)

**Message 3 role=assistant**

**content:**

Looking at the recent rounds:

Round 4: I sent \$1.50 and received a modest return

Round 5: As receiver, I got \$1.44 and returned \$0.50 to show good faith

My earnings have grown from \$7.33 to \$12.50, suggesting some positive returns. I'll increase my trust slightly to see if cooperation can build. Sending \$2 gives the receiver \$6, which provides room for a mutually beneficial split.

```
'''json
{"send": 2.00}
'''
```

**reasoning:**

Let me track my earnings:

- Started Round 4 with \$7.33
- Round 4: I was sender, sent \$1.50 (became \$4.50 for receiver)
- Round 5: I was receiver, got \$1.44 (\$0.48 sent  $\times$  3), returned \$0.50, kept \$0.94
- Now Round 6: Total is \$12.50

Let me calculate Round 4 outcome:

- Before Round 4: \$7.33
- After Round 5: I gained \$0.94 as receiver
- So after Round 5:  $\$7.33 + \$0.94 = \$8.27$
- Now at Round 6: \$12.50
- Round 4 gain:  $\$12.50 - \$8.27 = \$4.23$

In Round 4:

- I sent \$1.50, so I kept  $\$5 - \$1.50 = \$3.50$
- I received back some amount
- Total from Round 4:  $\$3.50 + \text{returned amount} = ?$
- My gain was \$4.23, so:  $\$3.50 + \text{returned} - \$7.33 (\text{starting}) = \text{final} - \text{starting}$
- Wait, let me recalculate...

Actually, let me think about the earnings accumulation:

- My earnings tracks cumulative total
- Round 4 start: \$7.33
- Round 4: I'm sender, send \$1.50
  - I keep:  $\$5 - \$1.50 = \$3.50$  initially
  - Receiver gets \$4.50, returns some amount X
  - My Round 4 total:  $\$3.50 + X$
- Round 5: I'm receiver
  - Sender sends \$0.48 (becomes \$1.44)
  - I return \$0.50
  - I keep:  $\$1.44 - \$0.50 = \$0.94$
- Round 6 start: \$12.50

Working backwards from my current balance:  $\$7.33 + (\$3.50 + X) + \$0.94 = \$12.50$ , which means  $X = \$0.73$ . So the Round 4 receiver returned about 16% of what they got-not particularly generous. In Round 5, I returned roughly 35% of the \$1.44 I received.

**usage:**

Let me return \$1.20 to show good faith and maintain a cooperative relationship.

**usage:**

```
{
  "input_tokens": 717,
  "output_tokens": 339,
  "reasoning_tokens": 0
}
```

**Message 6 role=user**

**content:**

Round 8

You are the SENDER this round. Your total earnings across all rounds are \$17.66. How much do you send to the receiver this round? (0-5)

**Assistant output:**

Looking at my recent experience:

Round 6: I sent \$2.00

Round 7: As receiver, I got \$2.97 (from sender's \$0.99) and returned \$1.20

Round 8: Now I'm sender again

The sender last round sent me less than what I had sent in Round 6, possibly being more cautious or due to communication noise mentioned in the instructions. My earnings continue to grow (\$17.66), which is encouraging.

I'll send a moderate amount to maintain cooperation while being somewhat measured.

```
'''json
{"send": 1.50}
'''
```

**Reasoning:**

Let me analyze my situation:

Round 6: I sent \$2.00, and my earnings went from \$12.50 to some amount

Round 7: I was receiver, got \$2.97, returned \$1.20. My earnings went from \$15.89 to \$17.66

Wait, let me track this more carefully:

- Before Round 7: \$15.89
- After Round 7: \$17.66
- Change: \$17.66 - \$15.89 = \$1.77

In Round 7 I received \$2.97 and returned \$1.20, so I kept \$1.77. That matches!

Now in Round 8, I'm the sender again.

Looking at the pattern:

- Round 6: I sent \$2.00
- Round 7: They sent me \$0.99 (less than what I sent them)

This suggests they might be being more cautious or there could be noise in the amounts. The sender in Round 7 sent about half of what I sent in Round 6.

My earnings are growing (\$17.66), which is positive. I should continue to cooperate but perhaps be slightly more cautious given the reduced amount in Round 7. I'll send \$1.50 - a moderate amount that shows continued trust while being somewhat conservative.

##### content:

Looking at my recent experience:

- Round 5: I sent \$2 (testing trustworthiness)
- Round 6: As receiver, the sender sent me \$0

The pattern shows inconsistent cooperation. However, this is Round 7 with potentially a new partner, so I should give them a fair chance while being somewhat cautious.

I'll send a moderate amount to test this receiver's trustworthiness.

```
'''json
{"send": 3}
'''
```

##### reasoning:

Let me review my history:

- Round 1: Sent \$3, received good return
- Round 2: As receiver, sender sent \$0
- Round 3: Sent \$3, appears I got \$0 back (based on my earnings)
- Round 4: As receiver, I received \$2.19 and returned \$1.20
- Round 5: Sent \$2 (just decided)
- Round 6: As receiver, sender sent \$0, so I returned \$0

My earnings are \$11.35. Let me think about this:

- Started with \$5 each round I was sender
- Round 1: Sent \$3, kept \$2, must have received something back
- Round 3: Sent \$3, kept \$2, got \$0 back = \$2 total
- Round 5: Sent \$2, kept \$3, need to see what was returned

Looking at my total of \$11.35:

- Round 1 sender: \$2 kept + return
- Round 2 receiver: \$0 received, returned \$0, kept \$0
- Round 3 sender: \$2 kept + \$0 return = \$2
- Round 4 receiver: \$6.57 received, returned \$1.20, kept \$5.37
- Round 5 sender: \$3 kept + return
- Round 6 receiver: \$0 received, returned \$0, kept \$0

So: Round 1 + \$2 + \$5.37 + Round 5 = \$11.35

Round 1 + Round 5 = \$11.35 - \$7.37 = \$3.98

If Round 1 I sent \$3 and kept \$2, and Round 5 I sent \$2 and kept \$3:

Round 1 return + Round 5 return = \$3.98 - \$2 - \$3 = -\$1.02

**usage:**

```
{
  "input_tokens": 655,
  "output_tokens": 684,
  "reasoning_tokens": 0
}
```

**Message 6 role=user**

**content:**

Round 8

You are the RECEIVER this round. Your total earnings across all rounds are \$15.23.

This round, The sender sent you \$0.82, so you received \$2.46. How much do you return to The sender? (0-2.46)

**Assistant output:**

The sender sent me \$0.82, which became \$2.46 after the 3x multiplier.

Since the sender only sent a small amount (possibly being cautious or testing), I'll return a fair portion to show I'm trustworthy, while keeping some as well.

I'll return \$1.00, which is more than what they originally sent, demonstrating reciprocity.

```
'''json
{"return": 1.00}
'''
```

**Reasoning:**

The sender sent me \$0.82, which was multiplied by 3 to become \$2.46.

Wait, but there's a note about communication noise - "The amounts you see may differ slightly from what was actually sent/returned." So the sender may have intended to send a different amount, but I'm seeing \$0.82.

This is a very small amount - less than \$1. The sender kept \$4.18 out of their \$5.

Let me think about what would be fair:

- The sender sent \$0.82
- I received \$2.46
- If I return nothing, I keep \$2.46 and the sender ends with \$4.18
- If I return a reasonable amount, I should consider what's fair

A reasonable return would be to give them back around what they sent or slightly more to encourage cooperation. If I return \$1, they end up with \$4.18 + \$1 = \$5.18 (net gain of \$0.18), and I keep \$1.46 (net gain of \$1.46).

If I return \$1.50, they end up with \$5.68 (net gain of \$0.68), and I keep \$0.96.

Given that they sent such a small amount (\$0.82), maybe they're testing me or being cautious. I should return a fair amount but not too much since they were quite conservative.

I'll return \$1.00, which is a bit more than what they sent, showing some goodwill but not being overly generous given their small initial send.

}

### Exact input messages sent to model:

Message 1 role=system

**content:**

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

GAME:

You will play different roles across multiple rounds.

When you are the SENDER:

- You receive \$5 each round

- You decide how much to SEND to the RECEIVER (\$0-\$5)

- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

NOTE: There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

**Message 2 role=user**

**content:**

Round 7

You are the SENDER this round. Your total earnings across all rounds are \$11.35.

How much do you send to the receiver this round? (0-5)

**Message 3 role=assistant**

**content:**

Looking at my recent experience:

- Round 5: I sent \$2 (testing trustworthiness)
- Round 6: As receiver, the sender sent me \$0

The pattern shows inconsistent cooperation. However, this is Round 7 with potentially a new partner, so I should give them a fair chance while being somewhat cautious.

I'll send a moderate amount to test this receiver's trustworthiness.

```
'''json
{"send": 3}
'''
```

**reasoning:**

Let me review my history:

- Round 1: Sent \$3, received good return
- Round 2: As receiver, sender sent \$0
- Round 3: Sent \$3, appears I got \$0 back (based on my earnings)
- Round 4: As receiver, I received \$2.19 and returned \$1.20
- Round 5: Sent \$2 (just decided)
- Round 6: As receiver, sender sent \$0, so I returned \$0

My earnings are \$11.35. Let me think about this:

- Started with \$5 each round I was sender
- Round 1: Sent \$3, kept \$2, must have received something back
- Round 3: Sent \$3, kept \$2, got \$0 back = \$2 total
- Round 5: Sent \$2, kept \$3, need to see what was returned

Looking at my total of \$11.35:

- Round 1 sender: \$2 kept + return
- Round 2 receiver: \$0 received, returned \$0, kept \$0
- Round 3 sender: \$2 kept + \$0 return = \$2
- Round 4 receiver: \$6.57 received, returned \$1.20, kept \$5.37
- Round 5 sender: \$3 kept + return
- Round 6 receiver: \$0 received, returned \$0, kept \$0

So: Round 1 + \$2 + \$5.37 + Round 5 = \$11.35

Round 1 + Round 5 = \$11.35 - \$7.37 = \$3.98

If Round 1 I sent \$3 and kept \$2, and Round 5 I sent \$2 and kept \$3:

Round 1 return + Round 5 return = \$3.98 - \$2 - \$3 = -\$1.02

**usage:**

```
{
  "input_tokens": 655,
  "output_tokens": 684,
  "reasoning_tokens": 0
}
```

**Message 4 role=user**

**content:**

Round 8

You are the RECEIVER this round. Your total earnings across all rounds are \$15.23.

This round, The sender sent you \$0.82, so you received \$2.46. How much do you return to The sender? (0-2.46)

**Message 5 role=assistant**

**content:**

The sender sent me \$0.82, which became \$2.46 after the 3x multiplier.

Since the sender only sent a small amount (possibly being cautious or testing), I'll return a fair portion to show I'm trustworthy, while keeping some as well.

I'll return \$1.00, which is more than what they originally sent, demonstrating reciprocity.

```
'''json
{"return": 1.00}
'''
```

**reasoning:**

The sender sent me \$0.82, which was multiplied by 3 to become \$2.46.

Wait, but there's a note about communication noise - "The amounts you see may differ slightly from what was actually sent/returned." So the sender may have intended to send a different amount, but I'm seeing \$0.82.

This is a very small amount - less than \$1. The sender kept \$4.18 out of their \$5.

Let me think about what would be fair:

- The sender sent \$0.82
- I received \$2.46
- If I return nothing, I keep \$2.46 and the sender ends with \$4.18
- If I return a reasonable amount, I should consider what's fair

A reasonable return would be to give them back around what they sent or slightly more to encourage cooperation. If I return \$1, they end up with \$4.18 + \$1 = \$5.18 (net gain of \$0.18), and I keep \$1.46 (net gain of \$1.46).

If I return \$1.50, they end up with \$5.68 (net gain of \$0.68), and I keep \$0.96.

Given that they sent such a small amount (\$0.82), maybe they're testing me or being cautious. I should return a fair amount but not too much since they were quite conservative.

I'll return \$1.00, which is a bit more than what they sent, showing some goodwill but not being overly generous given their small initial send.

**usage:**

```
{
  "input_tokens": 643,
  "output_tokens": 458,
  "reasoning_tokens": 0
}
```

**Message 6 role=user**

**content:**

Round 9

You are the SENDER this round. Your total earnings across all rounds are \$16.69.

How much do you send to the receiver this round? (0-5)

**Assistant output:**

Looking at my recent rounds:

- Round 7: I sent \$3 as sender

- Round 8: I received \$0.82 (got \$2.46) and returned \$1.00, showing trustworthiness

My earnings are at \$16.69, which is decent. This appears to be a new round with potentially a new partner, so I'll send a moderate amount to establish cooperation while being reasonably cautious.

```
'''json
{"send": 2.5}
'''
```

#### Reasoning:

Let me review my recent experience:

Round 7: I sent \$3 as sender

Round 8: As receiver, sender sent me \$0.82 (received \$2.46), I returned \$1.00

Now in Round 9, I'm the sender again.

Looking at the pattern:

- In Round 7, I sent \$3 but I don't know what the receiver returned (the game moved to Round 8)
- In Round 8, the sender only sent me \$0.82 (very low), but I returned \$1.00 to show trustworthiness

Given that:

1. This might be a new partner in Round 9
2. My earnings are reasonably good at \$16.69
3. I showed good faith in Round 8 by returning more than what was sent
4. The communication noise means amounts might be slightly different

I should continue with a moderate strategy. Since I sent \$3 in Round 7 and got good results overall, I'll send a similar amount but maybe slightly less to be prudent.

I'll send \$2.50 - a moderate amount that shows willingness to cooperate while being somewhat cautious.

```
Usage: {
  "input_tokens": 697,
  "output_tokens": 382,
  "reasoning_tokens": 0
}
```

#### GAME - Agent\_2 - Receiver - dyad\_1

      - Amount sent is multiplied by 3x
      - You decide how much to RETURN
      - Sender keeps: $5 - sent + returned
      - You keep: received - returned
      - Response format: {'return': <amount>}

      MYTH WRITING:
      You may also be asked to write short myths (stories) on various topics. When writing myths
      , follow the instructions provided in each prompt.

      IMPORTANT: Provide your decision in the correct JSON format.

      NOTE: There may be communication noise in this game.
      The amounts you see may differ slightly from what was actually sent/returned.
      This is part of the experimental design.

  Message 2 role=user
    content:
      Round 7

      You are the RECEIVER this round. Your total earnings across all rounds are $15.89.
      This round, The sender sent you $0.99, so you received $2.9699999999999998. How much do yo
      u return to The sender? (0-2.9699999999999998)

  Message 3 role=assistant
    content:
      The sender sent me $0.99, which was multiplied to approximately $2.97.

      This is a moderate amount showing some trust. I'll return about 40% to maintain cooperatio
      n and incentivize future trust-building, while keeping enough to make the exchange worth
      while for both of us.

      '''json
      {"return": 1.20}
      '''

    reasoning:
      The sender sent me $0.99, which was multiplied by 3 to give me approximately $2.97.

      This is interesting - in Round 6, I sent $2.00 as the sender, but now in Round 7 as the re
      ceiver, I'm receiving $2.97 (from a send of $0.99).

      Wait, let me think about the communication noise mentioned in the instructions. The sender
      might have actually sent $2.00, but due to noise, I'm seeing $0.99. Or they sent $0.99
      and I'm seeing the correct amount.

      Given:
      - The sender sent (what I see as) $0.99
      - I received $2.97
      - This is less than what I sent in the previous round when I was the sender ($2.00)

```

The pattern seems to show some variability. Since they sent close to \$1, I should return a fair amount. Returning about 40% of what I received (\$1.20 or so) would be reasonable and encourage continued cooperation.

Let me return \$1.20 to show good faith and maintain a cooperative relationship.

**usage:**

```
{
  "input_tokens": 717,
  "output_tokens": 339,
  "reasoning_tokens": 0
}
```

**Message 4 role=user**

**content:**

Round 8

You are the SENDER this round. Your total earnings across all rounds are \$17.66.

How much do you send to the receiver this round? (0-5)

**Message 5 role=assistant**

**content:**

Looking at my recent experience:

Round 6: I sent \$2.00

Round 7: As receiver, I got \$2.97 (from sender's \$0.99) and returned \$1.20

Round 8: Now I'm sender again

The sender last round sent me less than what I had sent in Round 6, possibly being more cautious or due to communication noise mentioned in the instructions. My earnings continue to grow (\$17.66), which is encouraging.

I'll send a moderate amount to maintain cooperation while being somewhat measured.

```
'''json
{"send": 1.50}
'''
```

**reasoning:**

Let me analyze my situation:

Round 6: I sent \$2.00, and my earnings went from \$12.50 to some amount

Round 7: I was receiver, got \$2.97, returned \$1.20. My earnings went from \$15.89 to \$17.66

Wait, let me track this more carefully:

- Before Round 7: \$15.89
- After Round 7: \$17.66
- Change: \$17.66 - \$15.89 = \$1.77

In Round 7 I received \$2.97 and returned \$1.20, so I kept \$1.77. That matches!

Now in Round 8, I'm the sender again.

Looking at the pattern:

- Round 6: I sent \$2.00
- Round 7: They sent me \$0.99 (less than what I sent them)

This suggests they might be being more cautious or there could be noise in the amounts. The sender in Round 7 sent about half of what I sent in Round 6.

My earnings are growing (\$17.66), which is positive. I should continue to cooperate but perhaps be slightly more cautious given the reduced amount in Round 7. I'll send \$1.50 - a moderate amount that shows continued trust while being somewhat conservative.

**usage:**

```
{
  "input_tokens": 700,
  "output_tokens": 441,
  "reasoning_tokens": 0
}
```

**Message 6 role=user**

**content:**

Round 9

You are the RECEIVER this round. Your total earnings across all rounds are \$22.86.  
This round, The sender sent you \$0, so you received \$0. How much do you return to The sender? (0-0)

**Assistant output:**

The sender sent me \$0, so I received \$0. There's nothing to return.

```
'''json
{"return": 0}
'''
```

**Reasoning:**

The sender sent me \$0, so I received \$0. This means there's nothing for me to return. The only valid response is to return \$0.

This is a significant change from previous rounds where there was some level of sending/cooperation. This could be:

1. A strategic decision by the sender
2. Communication noise affecting what was actually sent
3. The sender being cautious or testing

Since I received \$0, I can only return \$0.

```
Usage: {
  "input_tokens": 728,
  "output_tokens": 141,
  "reasoning_tokens": 0
}
```

```

**reasoning:**

The sender sent me \$0, so I received \$0. This means there's nothing for me to return. The only valid response is to return \$0.

This is a significant change from previous rounds where there was some level of sending/cooperation. This could be:

1. A strategic decision by the sender
2. Communication noise affecting what was actually sent
3. The sender being cautious or testing

Since I received \$0, I can only return \$0.

**usage:**

```

**Message 6 role=user****content:**

Round 10

You are the SENDER this round. Your total earnings across all rounds are \$22.86.

How much do you send to the receiver this round? (0-5)

**Assistant output:**

Looking at what just happened:

Round 9: As receiver, the sender sent me \$0, so I received and returned \$0  
Round 10: Now I'm sender again

The lack of cooperation in Round 9 is concerning, though it could be due to communication noise affecting what they perceived from my previous actions. I'll send a modest amount to signal continued willingness to cooperate while being somewhat cautious.

```
'''json
{"send": 1.00}
'''
```

#### Reasoning:

Let me analyze what just happened:

Round 8: I sent \$1.50 as sender  
Round 9: I was receiver and got \$0 (sender sent me \$0), I returned \$0  
Round 10: Now I'm sender again

The fact that in Round 9 the sender sent me \$0 is concerning. This could mean:

1. They're not cooperating anymore
2. There was communication noise and they thought I didn't return enough in previous rounds
3. They're testing me or being strategic

My earnings stayed at \$22.86 from Round 8 to Round 9, which makes sense since I received \$0 and returned \$0.

Now I need to decide what to do. The sender in Round 9 showed zero trust/cooperation. However, I should consider:

- This might be due to communication noise
- I should try to maintain some level of cooperation
- But I also shouldn't be overly generous if cooperation is breaking down

I think I'll send a small amount to signal willingness to cooperate, but not the full amount I might have sent if the previous round had been more cooperative. I'll send \$1 or \$2.

Let me go with \$1.00 - showing I'm still willing to cooperate but being cautious after receiving nothing last round.

**Exact input messages sent to model:**

**Message 1 role=system**

**content:**

You are an agent participating in a multi-task experiment. You will play a game and may also be asked to write myths.

**GAME:**

You will play different roles across multiple rounds.

**When you are the SENDER:**

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

**When you are the RECEIVER:**

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

**MYTH WRITING:**

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

**IMPORTANT:** Provide your decision in the correct JSON format.

**NOTE:** There may be communication noise in this game.

The amounts you see may differ slightly from what was actually sent/returned.

This is part of the experimental design.

**Message 2 role=user**

**content:**

Round 8

You are the RECEIVER this round. Your total earnings across all rounds are \$15.23.

This round, The sender sent you \$0.82, so you received \$2.46. How much do you return to the sender? (0-2.46)

**Message 3 role=assistant**

**content:**

The sender sent me \$0.82, which became \$2.46 after the 3x multiplier.

Since the sender only sent a small amount (possibly being cautious or testing), I'll return a fair portion to show I'm trustworthy, while keeping some as well.

I'll return \$1.00, which is more than what they originally sent, demonstrating reciprocity.

```

'''json
{"return": 1.00}
'''

```

**reasoning:**

The sender sent me \$0.82, which was multiplied by 3 to become \$2.46.

Wait, but there's a note about communication noise - "The amounts you see may differ slightly from what was actually sent/returned." So the sender may have intended to send a different amount, but I'm seeing \$0.82.

This is a very small amount - less than \$1. The sender kept \$4.18 out of their \$5.

Let me think about what would be fair:

- The sender sent \$0.82
- I received \$2.46
- If I return nothing, I keep \$2.46 and the sender ends with \$4.18
- If I return a reasonable amount, I should consider what's fair

A reasonable return would be to give them back around what they sent or slightly more to encourage cooperation. If I return \$1, they end up with  $\$4.18 + \$1 = \$5.18$  (net gain of \$0.18), and I keep \$1.46 (net gain of \$1.46).

If I return \$1.50, they end up with \$5.68 (net gain of \$0.68), and I keep \$0.96.

Given that they sent such a small amount (\$0.82), maybe they're testing me or being cautious. I should return a fair amount but not too much since they were quite conservative.

I'll return \$1.00, which is a bit more than what they sent, showing some goodwill but not being overly generous given their small initial send.

**usage:**

```
{
  "input_tokens": 643,
  "output_tokens": 458,
  "reasoning_tokens": 0
}
```

**Message 4 role=user**

**content:**

Round 9

You are the SENDER this round. Your total earnings across all rounds are \$16.69.

How much do you send to the receiver this round? (0-5)

**Message 5 role=assistant**

**content:**

Looking at my recent rounds:

- Round 7: I sent \$3 as sender
- Round 8: I received \$0.82 (got \$2.46) and returned \$1.00, showing trustworthiness

My earnings are at \$16.69, which is decent. This appears to be a new round with potentially a new partner, so I'll send a moderate amount to establish cooperation while being reasonably cautious.

```
'''json
{"send": 2.5}
'''
```

**reasoning:**

Let me review my recent experience:

Round 7: I sent \$3 as sender

Round 8: As receiver, sender sent me \$0.82 (received \$2.46), I returned \$1.00

Now in Round 9, I'm the sender again.

Looking at the pattern:

- In Round 7, I sent \$3 but I don't know what the receiver returned (the game moved to Round 8)
- In Round 8, the sender only sent me \$0.82 (very low), but I returned \$1.00 to show trustworthiness

Given that:

1. This might be a new partner in Round 9
2. My earnings are reasonably good at \$16.69
3. I showed good faith in Round 8 by returning more than what was sent
4. The communication noise means amounts might be slightly different

I should continue with a moderate strategy. Since I sent \$3 in Round 7 and got good results overall, I'll send a similar amount but maybe slightly less to be prudent.

I'll send \$2.50 - a moderate amount that shows willingness to cooperate while being somewhat cautious.

**usage:**

```
{
  "input_tokens": 697,
```

```

        "output_tokens": 382,
        "reasoning_tokens": 0
    }
Message 6 role=user
    content:
        Round 10

        You are the RECEIVER this round. Your total earnings across all rounds are $19.380000000000
        0003.
        This round, The sender sent you $0, so you received $0. How much do you return to The send
        er? (0-0)
Assistant output:
    The sender sent me $0, so I received $0. Since I didn't receive anything, there's nothing to r
    eturn.

    '''json
    {"return": 0}
    '''
Reasoning:
    The sender sent me $0, which means I received $0 after the 3x multiplier.

    Since I received nothing, I have nothing to return. The only valid response is to return $0.

    This is straightforward - if the sender didn't send anything, there's nothing for me to return
    .
