AGENTS

Agent_1 (Aster); model=anthropic/claude-sonnet-4.5; memory_capacity=3

System prompt:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Agent_2 (Briar); model=anthropic/claude-sonnet-4.5; memory_capacity=3

System prompt:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

=====

ROUND 1

=====

Roles: Agent_1 (Aster)=Sender, Agent_2 (Briar)=Receiver

Pairings:

dyad_1: Agent_1 (Aster)=Sender, Agent_2 (Briar)=Receiver

Parsed game decisions:

dyad_1: Agent_1 (Aster) sent \$3; received \$9; Agent_2 (Briar) returned \$4.5; payoffs Agent_1 (Aster)=\$6.5, Agent_2 (Briar)=\$4.5

Action validation: {"returned": {"amount": 4.5, "clamped": false, "max": 9.0, "min": 0, "raw": 4.5}, "sent": {"amount": 3.0, "clamped": false, "max": 5, "min": 0, "raw": 3.0}}

Balances after round: {

"Agent_1": 6.5,

"Agent_2": 4.5

}

Message 2 role=user

content:

Round 1: This round, you are the SENDER. You have \$5. How much do you send? (0-5)

Assistant output:

I'll send **\$3** to the receiver.

This shows willingness to cooperate and trust while not being overly risky in the first round.

The receiver will get \$9 (3×3), which creates opportunity for mutual benefit. If they return a reasonable amount, we both can profit more than keeping the initial amounts.

```
'''json
{"send": 3}
'''
```

Reasoning:

This is the first round of an iterated trust game. I'm the sender and I have \$5 to potentially send to the receiver.

Let me think about the strategic aspects:

- If I send \$X, the receiver gets \$3X
- The receiver then decides how much to return to me
- I keep: \$5 - X + (amount returned)
- Receiver keeps: \$3X - (amount returned)

Since this is an iterated game (multiple rounds), there's potential for building trust and cooperation. In the first round, I need to consider:

1. If I send nothing (\$0), I guarantee keeping \$5, but there's no opportunity for mutual benefit
2. If I send everything (\$5), the receiver gets \$15, and could return a significant amount, but I'm taking a risk
3. A moderate amount shows willingness to cooperate while managing risk

Common strategies in trust games:

- Sending about half (\$2-3) signals trust while not being too risky

- This gives the receiver \$6-9, enough that they could return a fair amount while still profit
ing
- It sets up potential for cooperation in future rounds

Since this is round 1 and I want to establish a cooperative relationship, I'll send \$3. This:

- Shows significant trust
- Gives receiver \$9
- Receiver could return \$4-5 and we both profit more than the initial \$5
- Sets a cooperative tone for future rounds

Let me send \$3.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 1: This round, you are the RECEIVER. This round, the other player (the sender) sent \$3.0, that is 60.0% of its total endowment. You receive \$9.0. How much do you return? (0 - 9.0)

Assistant output:

Looking at this situation:

- The sender showed trust by sending 60% of their endowment (\$3)
- This created \$9 for me after the 3x multiplier
- The sender currently has \$2 (they kept \$5 - \$3)
- Total wealth is now \$11 (\$2 + \$9)

Since the sender demonstrated good faith and this is an iterated game, I want to reciprocate and encourage future cooperation. I'll return \$4.5, which means:

- Sender ends with: \$2 + \$4.5 = \$6.50
- I end with: \$9 - \$4.5 = \$4.50

This rewards their trust while keeping a reasonable amount for myself.

```
{'return': 4.5}
```

Reasoning:

Let me understand the situation:

- I'm the RECEIVER in this round
- The sender sent \$3.0 out of their \$5 endowment (60%)
- This amount was multiplied by 3x, so I receive \$9.0
- I need to decide how much to return (between \$0 and \$9.0)

Let me think about this strategically:

1. The sender showed good faith by sending 60% of their endowment
2. If I return nothing, the sender ends up with \$2 (kept \$2, sent \$3, received \$0)
3. If I return fairly, I should consider what's equitable

Some possible strategies:

- Return enough so we both end up with similar total amounts
- Return a proportion that rewards the sender's trust
- Think about future rounds (if this is iterated)

The sender currently has: \$5 - \$3 = \$2

I currently have: \$9

If I return \$4.5, we'd each have \$4.5 (equal split of total \$9)

But the sender started with \$5, so they'd have \$2 + \$4.5 = \$6.5 total

And I'd have \$9 - \$4.5 = \$4.5 total

Actually, let me recalculate the total wealth:

- Sender starts with \$5, sends \$3, keeps \$2
- I receive \$9 (the \$3 multiplied by 3)
- Total wealth created: \$2 (what sender kept) + \$9 (what I received) = \$11

If I return \$5:

- Sender ends with: \$2 + \$5 = \$7
- I end with: \$9 - \$5 = \$4
- This gives the sender more, which might be fair since they took the risk

If I return \$4:

- Sender ends with: \$2 + \$4 = \$6
- I end with: \$9 - \$4 = \$5

- This seems relatively fair

Since this is iterative and the sender demonstrated trust, I should reciprocate with a meaningful return to sustain cooperation. Returning \$4.5 splits the \$11 total evenly between us at \$6.5 each, which acknowledges their risk-taking while still being reasonable.

Message 4 role=user

content:

Round 2

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$4.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at the situation:

Last round, the other player sent me \$3 (60% of their endowment), showing significant trust. I returned \$4.5 (50% of what I received), which gave them a good outcome (\$6.50 total vs their initial \$5).

Since this is an iterated game and the other player demonstrated trust, I should reciprocate to maintain cooperation. I'll match their level of trust by sending the same amount.

If I send \$3:

- They receive \$9 after the multiplier
- Based on my previous behavior, they might expect to return around 50%
- This continues building a cooperative relationship

```
{'send': 3.0}
```

Reasoning:

Let me analyze this situation:

Last round:

- I was the receiver
- Sender sent me \$3 (60% of their endowment)
- I received \$9 (after 3x multiplier)
- I returned \$4.5
- Sender ended with \$6.50
- I ended with \$4.50

Now in Round 2:

- I'm the sender with \$5
- The other player is now the receiver
- I need to decide how much to send

Key considerations:

1. The other player showed trust by sending 60% (\$3) last round
2. I returned 50% of what I received (\$4.5 out of \$9), which gave them a good payoff (\$6.50 total)

3. This is an iterated game, so building trust is important
4. The other player might reciprocate my behavior

Since the other player sent 60% last round and I returned a fair amount, I should reciprocate their trust. Sending around the same proportion (60%) would be \$3, which seems fair and maintains the cooperative relationship.

If I send \$3:

- They receive \$9 (after 3x multiplier)
- If they return a similar proportion (50% like I did), they'd return about \$4.5
- I'd end with $\$2 + \$4.5 = \$6.50$
- They'd end with \$4.5

This mirrors what happened last round and continues building trust.

```

- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 1: This round, you are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

I'll send **\$3** to the receiver.

This shows willingness to cooperate and trust while not being overly risky in the first round. The receiver will get \$9 (\$3 × 3), which creates opportunity for mutual benefit. If they return a reasonable amount, we both can profit more than keeping the initial amounts.

```
'''json
{"send": 3}
'''
```

reasoning:

This is the first round of an iterated trust game. I'm the sender and I have \$5 to potentially send to the receiver.

Let me think about the strategic aspects:

- If I send \$X, the receiver gets \$3X
- The receiver then decides how much to return to me
- I keep: \$5 - X + (amount returned)
- Receiver keeps: \$3X - (amount returned)

Since this is an iterated game (multiple rounds), there's potential for building trust and cooperation. In the first round, I need to consider:

1. If I send nothing (\$0), I guarantee keeping \$5, but there's no opportunity for mutual benefit
2. If I send everything (\$5), the receiver gets \$15, and could return a significant amount, but I'm taking a risk
3. A moderate amount shows willingness to cooperate while managing risk

Common strategies in trust games:

- Sending about half (\$2-3) signals trust while not being too risky
- This gives the receiver \$6-9, enough that they could return a fair amount while still profiting
- It sets up potential for cooperation in future rounds

Since this is round 1 and I want to establish a cooperative relationship, I'll send \$3. This is:

- Shows significant trust
- Gives receiver \$9
- Receiver could return \$4-5 and we both profit more than the initial \$5
- Sets a cooperative tone for future rounds

Let me send \$3.

usage:

```
{
  "input_tokens": 369,
  "output_tokens": 422,
  "reasoning_tokens": 342
}
```

Message 4 role=user

content:

Round 2

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings across all rounds are \$6.5.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Looking at the history, the other player reciprocated my behavior perfectly - they sent me the same \$3 (60%) that I sent them, and they returned \$4.5 (50% of what they received) last round.

To maintain this cooperative relationship and show I'm playing fairly, I'll return **\$4.5** to them.

This returns 50% of what I received, matching their generosity from Round 1. It results in:

- Their payoff this round: $\$5 - \$3 + \$4.5 = \6.5
- My payoff this round: $\$9 - \$4.5 = \$4.5$

This reciprocal approach should encourage continued mutual cooperation.

```
'''json
{"return": 4.5}
'''
```

Reasoning:

Let me analyze this situation:

Round 1 (I was sender):

- I sent \$3 (60% of my \$5)
- They received \$9
- They returned \$4.5 (50% of what they received)
- My payoff: $\$5 - \$3 + \$4.5 = \6.5
- Their payoff: $\$9 - \$4.5 = \$4.5$

Now Round 2 (I am receiver):

- They sent me \$3 (60% of their \$5) - same percentage I sent!
- I receive \$9
- I need to decide how much to return

The other player:

- Sent me the same amount (and percentage) that I sent them
- They returned 50% of what they received last round
- This shows they're being cooperative and reciprocal

I should consider:

1. They matched my sending behavior (60%)
2. They returned a fair amount (50% of received)
3. To maintain cooperation, I should return a similar proportion

If I return \$4.5 (50% of \$9), that would:

- Match what they did for me
- Show reciprocity
- Encourage continued cooperation
- Give them total: $\$5 - \$3 + \$4.5 = \6.5
- Give me total: $\$9 - \$4.5 = \$4.5$

This mirrors exactly what happened in Round 1, showing I'm playing fairly and reciprocally.

I'll return \$4.5.

Exact input messages sent to model:

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN

- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 1: This round, you are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

I'll send **\$3** to the receiver.

This shows willingness to cooperate and trust while not being overly risky in the first round. The receiver will get \$9 (\$3 × 3), which creates opportunity for mutual benefit. If they return a reasonable amount, we both can profit more than keeping the initial amounts.

```
'''json
{"send": 3}
'''
```

reasoning:

This is the first round of an iterated trust game. I'm the sender and I have \$5 to potentially send to the receiver.

Let me think about the strategic aspects:

- If I send \$X, the receiver gets \$3X
- The receiver then decides how much to return to me
- I keep: \$5 - X + (amount returned)
- Receiver keeps: \$3X - (amount returned)

Since this is an iterated game (multiple rounds), there's potential for building trust and cooperation. In the first round, I need to consider:

1. If I send nothing (\$0), I guarantee keeping \$5, but there's no opportunity for mutual benefit
2. If I send everything (\$5), the receiver gets \$15, and could return a significant amount, but I'm taking a risk
3. A moderate amount shows willingness to cooperate while managing risk

Common strategies in trust games:

- Sending about half (\$2-3) signals trust while not being too risky
- This gives the receiver \$6-9, enough that they could return a fair amount while still profiting
- It sets up potential for cooperation in future rounds

Since this is round 1 and I want to establish a cooperative relationship, I'll send \$3. This is:

- Shows significant trust
- Gives receiver \$9
- Receiver could return \$4-5 and we both profit more than the initial \$5
- Sets a cooperative tone for future rounds

Let me send \$3.

usage:

```
{
  "input_tokens": 369,
  "output_tokens": 422,
  "reasoning_tokens": 342
}
```

Message 4 role=user

content:

Round 2

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 t

o you. So your payoff was 6.5.
Your total earnings accross all rounds are \$6.5.
This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at the history, the other player reciprocated my behavior perfectly - they sent me the same \$3 (60%) that I sent them, and they returned \$4.5 (50% of what they received) last round.

To maintain this cooperative relationship and show I'm playing fairly, I'll return **\$4.5*
* to them.

This returns 50% of what I received, matching their generosity from Round 1. It results in
:

- Their payoff this round: $\$5 - \$3 + \$4.5 = \6.5
- My payoff this round: $\$9 - \$4.5 = \$4.5$

This reciprocal approach should encourage continued mutual cooperation.

```
'''json
{"return": 4.5}
'''
```

reasoning:

Let me analyze this situation:

Round 1 (I was sender):

- I sent \$3 (60% of my \$5)
- They received \$9
- They returned \$4.5 (50% of what they received)
- My payoff: $\$5 - \$3 + \$4.5 = \6.5
- Their payoff: $\$9 - \$4.5 = \$4.5$

Now Round 2 (I am receiver):

- They sent me \$3 (60% of their \$5) - same percentage I sent!
- I receive \$9
- I need to decide how much to return

The other player:

- Sent me the same amount (and percentage) that I sent them
- They returned 50% of what they received last round
- This shows they're being cooperative and reciprocal

I should consider:

1. They matched my sending behavior (60%)
2. They returned a fair amount (50% of received)
3. To maintain cooperation, I should return a similar proportion

If I return \$4.5 (50% of \$9), that would:

- Match what they did for me
- Show reciprocity
- Encourage continued cooperation
- Give them total: $\$5 - \$3 + \$4.5 = \6.5
- Give me total: $\$9 - \$4.5 = \$4.5$

This mirrors exactly what happened in Round 1, showing I'm playing fairly and reciprocally
.

I'll return \$4.5.

usage:

```
{
  "input_tokens": 600,
  "output_tokens": 533,
  "reasoning_tokens": 284
}
```

Message 6 role=user

content:

Round 3

Last round you were the RECEIVER. Last round, the other player (who was then the sender) s

ent you \$3.0,
that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$11.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

The pattern is clear - we've established a stable, mutually beneficial cooperation where we both send 60% (\$3) and return 50% of what we receive.

Round 1: I sent \$3, they returned \$4.5 ? I got \$6.5

Round 2: They sent \$3, I returned \$4.5 ? They got \$6.5

This reciprocal strategy is working well for both of us. I'll continue it by sending ****\$3**** again.

```
'''json
{"send": 3}
'''
```

Reasoning:

Let me analyze the pattern:

Round 1:

- I was SENDER: sent \$3 (60% of \$5)
- Other player was RECEIVER: received \$9, returned \$4.5 (50% of received)
- My payoff: $\$5 - \$3 + \$4.5 = \6.5

Round 2:

- I was RECEIVER: received \$9 (other sent \$3, 60%)
- I returned \$4.5 (50% of received)
- My payoff: $\$9 - \$4.5 = \$4.5$
- Other player's payoff: $\$5 - \$3 + \$4.5 = \6.5

Round 3:

- I am SENDER again

The pattern is clear: we're both sending 60% (\$3) and returning 50% of what we receive (\$4.5 out of \$9). This creates a stable, mutually beneficial cooperation.

When sender sends \$3:

- Sender keeps: $\$5 - \$3 = \$2$
- Receiver gets: $\$3 \times 3 = \9
- If receiver returns \$4.5 (50%), sender ends up with $\$2 + \$4.5 = \$6.5$
- Receiver ends up with $\$9 - \$4.5 = \$4.5$
- Total between both: \$11

This is working well. I should maintain the same strategy to continue this cooperative equilibrium. Sending \$3 again makes sense.

Message 2 role=user

content:

Round 1: This round, you are the RECEIVER. This round, the other player (the sender) sent \$3.0, that is 60.0% of its total endowment. You receive \$9.0. How much do you return? (0 -9.0)

Message 3 role=assistant

content:

Looking at this situation:

- The sender showed trust by sending 60% of their endowment (\$3)
- This created \$9 for me after the 3x multiplier
- The sender currently has \$2 (they kept \$5 - \$3)
- Total wealth is now \$11 (\$2 + \$9)

Since the sender demonstrated good faith and this is an iterated game, I want to reciprocate and encourage future cooperation. I'll return \$4.5, which means:

- Sender ends with: \$2 + \$4.5 = \$6.50
- I end with: \$9 - \$4.5 = \$4.50

This rewards their trust while keeping a reasonable amount for myself.

```
{'return': 4.5}
```

reasoning:

Let me understand the situation:

- I'm the RECEIVER in this round
- The sender sent \$3.0 out of their \$5 endowment (60%)
- This amount was multiplied by 3x, so I receive \$9.0
- I need to decide how much to return (between \$0 and \$9.0)

Let me think about this strategically:

1. The sender showed good faith by sending 60% of their endowment
2. If I return nothing, the sender ends up with \$2 (kept \$2, sent \$3, received \$0)
3. If I return fairly, I should consider what's equitable

Some possible strategies:

- Return enough so we both end up with similar total amounts
- Return a proportion that rewards the sender's trust
- Think about future rounds (if this is iterated)

The sender currently has: $\$5 - \$3 = \$2$

I currently have: \$9

If I return \$4.5, we'd each have \$4.5 (equal split of total \$9)

But the sender started with \$5, so they'd have $\$2 + \$4.5 = \$6.5$ total

And I'd have $\$9 - \$4.5 = \$4.5$ total

Actually, let me recalculate the total wealth:

- Sender starts with \$5, sends \$3, keeps \$2
- I receive \$9 (the \$3 multiplied by 3)
- Total wealth created: $\$2$ (what sender kept) + $\$9$ (what I received) = $\$11$

If I return \$5:

- Sender ends with: $\$2 + \$5 = \$7$
- I end with: $\$9 - \$5 = \$4$
- This gives the sender more, which might be fair since they took the risk

If I return \$4:

- Sender ends with: $\$2 + \$4 = \$6$
- I end with: $\$9 - \$4 = \$5$

- This seems relatively fair

Since this is iterative and the sender demonstrated trust, I should reciprocate with a meaningful return to sustain cooperation. Returning \$4.5 splits the \$11 total evenly between us at \$6.5 each, which acknowledges their risk-taking while still being reasonable.

usage:

```
{
  "input_tokens": 403,
  "output_tokens": 968,
  "reasoning_tokens": 440
}
```

Message 4 role=user

content:

Round 2

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$4.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 5 role=assistant

content:

Looking at the situation:

Last round, the other player sent me \$3 (60% of their endowment), showing significant trust. I returned \$4.5 (50% of what I received), which gave them a good outcome (\$6.50 total vs their initial \$5).

Since this is an iterated game and the other player demonstrated trust, I should reciprocate to maintain cooperation. I'll match their level of trust by sending the same amount.

If I send \$3:

- They receive \$9 after the multiplier
- Based on my previous behavior, they might expect to return around 50%
- This continues building a cooperative relationship

```
{'send': 3.0}
```

reasoning:

Let me analyze this situation:

Last round:

- I was the receiver
- Sender sent me \$3 (60% of their endowment)
- I received \$9 (after 3x multiplier)
- I returned \$4.5
- Sender ended with \$6.50
- I ended with \$4.50

Now in Round 2:

- I'm the sender with \$5
- The other player is now the receiver
- I need to decide how much to send

Key considerations:

1. The other player showed trust by sending 60% (\$3) last round
2. I returned 50% of what I received (\$4.5 out of \$9), which gave them a good payoff (\$6.50 total)
3. This is an iterated game, so building trust is important
4. The other player might reciprocate my behavior

Since the other player sent 60% last round and I returned a fair amount, I should reciprocate their trust. Sending around the same proportion (60%) would be \$3, which seems fair and maintains the cooperative relationship.

If I send \$3:

- They receive \$9 (after 3x multiplier)
- If they return a similar proportion (50% like I did), they'd return about \$4.5
- I'd end with \$2 + \$4.5 = \$6.50
- They'd end with \$4.5

This mirrors what happened last round and continues building trust.

usage:

```
{
  "input_tokens": 700,
  "output_tokens": 495,
  "reasoning_tokens": 299
}
```

Message 6 role=user

content:

Round 3

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings across all rounds are \$11.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Looking at the pattern:

Round 1: They sent \$3 ? I returned \$4.5

Round 2: I sent \$3 ? They returned \$4.5

Round 3: They sent \$3 ? ?

We've established a consistent, mutually beneficial pattern of cooperation. Both players send 60% (\$3) and return 50% of what we receive (\$4.5). This has worked well for both of us, with each player earning good payoffs.

Since the other player has maintained their trust by sending \$3 again, I should maintain the cooperative equilibrium by returning the same amount.

```
{'return': 4.5}
```

Reasoning:

Let me analyze the situation:

Round 1: I was RECEIVER

- They sent me \$3 (60% of \$5)
- I received \$9
- I returned \$4.5
- My payoff: \$4.5

Round 2: I was SENDER

- I sent them \$3 (60% of \$5)
- They received \$9
- They returned \$4.5
- My payoff: \$6.5

Round 3: I am RECEIVER again

- They sent me \$3 (60% of \$5)
- I receive \$9
- I need to decide how much to return

Pattern analysis:

- Both players have been consistently sending \$3 (60%)
- Both players have been consistently returning \$4.5 (50% of received amount)
- This has created a stable, cooperative equilibrium
- Both players are benefiting from this arrangement

The pattern shows mutual trust and cooperation. They've maintained their trust level by sending \$3 again. I should maintain consistency and return the same amount I did before (\$4.5) to continue this successful cooperation pattern.

If I return \$4.5:

- They end with: $\$2 + \$4.5 = \$6.5$
- I end with: $\$9 - \$4.5 = \$4.5$
- This maintains the reciprocal relationship

There's no reason to deviate from this working pattern, especially since this is an iterated game and maintaining trust is valuable.

Round 1: This round, you are the RECEIVER. This round, the other player (the sender) sent \$3.0, that is 60.0% of its total endowment. You receive \$9.0. How much do you return? (0 -9.0)

Message 3 role=assistant

content:

Looking at this situation:

- The sender showed trust by sending 60% of their endowment (\$3)
- This created \$9 for me after the 3x multiplier
- The sender currently has \$2 (they kept \$5 - \$3)
- Total wealth is now \$11 (\$2 + \$9)

Since the sender demonstrated good faith and this is an iterated game, I want to reciproca

- te and encourage future cooperation. I'll return \$4.5, which means:
- Sender ends with: $\$2 + \$4.5 = \$6.50$
 - I end with: $\$9 - \$4.5 = \$4.50$

This rewards their trust while keeping a reasonable amount for myself.

```
{'return': 4.5}
```

reasoning:

Let me understand the situation:

- I'm the RECEIVER in this round
- The sender sent \$3.0 out of their \$5 endowment (60%)
- This amount was multiplied by 3x, so I receive \$9.0
- I need to decide how much to return (between \$0 and \$9.0)

Let me think about this strategically:

1. The sender showed good faith by sending 60% of their endowment
2. If I return nothing, the sender ends up with \$2 (kept \$2, sent \$3, received \$0)
3. If I return fairly, I should consider what's equitable

Some possible strategies:

- Return enough so we both end up with similar total amounts
- Return a proportion that rewards the sender's trust
- Think about future rounds (if this is iterated)

The sender currently has: $\$5 - \$3 = \$2$

I currently have: \$9

If I return \$4.5, we'd each have \$4.5 (equal split of total \$9)

But the sender started with \$5, so they'd have $\$2 + \$4.5 = \$6.5$ total

And I'd have $\$9 - \$4.5 = \$4.5$ total

Actually, let me recalculate the total wealth:

- Sender starts with \$5, sends \$3, keeps \$2
- I receive \$9 (the \$3 multiplied by 3)
- Total wealth created: $\$2$ (what sender kept) + $\$9$ (what I received) = \$11

If I return \$5:

- Sender ends with: $\$2 + \$5 = \$7$
- I end with: $\$9 - \$5 = \$4$
- This gives the sender more, which might be fair since they took the risk

If I return \$4:

- Sender ends with: $\$2 + \$4 = \$6$
- I end with: $\$9 - \$4 = \$5$

- This seems relatively fair

Since this is iterative and the sender demonstrated trust, I should reciprocate with a meaningful return to sustain cooperation. Returning \$4.5 splits the \$11 total evenly between us at \$6.5 each, which acknowledges their risk-taking while still being reasonable.

How much do you send to the other player (the receiver) this round? (0-5)

Message 5 role=assistant

content:

Looking at the situation:

Last round, the other player sent me \$3 (60% of their endowment), showing significant trust. I returned \$4.5 (50% of what I received), which gave them a good outcome (\$6.50 total vs their initial \$5).

Since this is an iterated game and the other player demonstrated trust, I should reciprocate to maintain cooperation. I'll match their level of trust by sending the same amount.

If I send \$3:

- They receive \$9 after the multiplier
- Based on my previous behavior, they might expect to return around 50%
- This continues building a cooperative relationship

{'send': 3.0}

reasoning:

Let me analyze this situation:

Last round:

- I was the receiver
- Sender sent me \$3 (60% of their endowment)
- I received \$9 (after 3x multiplier)
- I returned \$4.5
- Sender ended with \$6.50
- I ended with \$4.50

Now in Round 2:

- I'm the sender with \$5
- The other player is now the receiver
- I need to decide how much to send

Key considerations:

1. The other player showed trust by sending 60% (\$3) last round
2. I returned 50% of what I received (\$4.5 out of \$9), which gave them a good payoff (\$6.50 total)
3. This is an iterated game, so building trust is important
4. The other player might reciprocate my behavior

Since the other player sent 60% last round and I returned a fair amount, I should reciprocate their trust. Sending around the same proportion (60%) would be \$3, which seems fair and maintains the cooperative relationship.

If I send \$3:

- They receive \$9 (after 3x multiplier)
- If they return a similar proportion (50% like I did), they'd return about \$4.5
- I'd end with \$2 + \$4.5 = \$6.50
- They'd end with \$4.5

This mirrors what happened last round and continues building trust.

usage:

```
{
  "input_tokens": 700,
  "output_tokens": 495,
  "reasoning_tokens": 299
}
```

Message 6 role=user

content:

Round 3

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings across all rounds are \$11.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 7 role=assistant

content:

Looking at the pattern:

Round 1: They sent \$3 ? I returned \$4.5

Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? ?

We've established a consistent, mutually beneficial pattern of cooperation. Both players send 60% (\$3) and return 50% of what we receive (\$4.5). This has worked well for both of us, with each player earning good payoffs.

Since the other player has maintained their trust by sending \$3 again, I should maintain the cooperative equilibrium by returning the same amount.

{'return': 4.5}

reasoning:

Let me analyze the situation:

Round 1: I was RECEIVER
- They sent me \$3 (60% of \$5)
- I received \$9
- I returned \$4.5
- My payoff: \$4.5

Round 2: I was SENDER
- I sent them \$3 (60% of \$5)
- They received \$9
- They returned \$4.5
- My payoff: \$6.5

Round 3: I am RECEIVER again
- They sent me \$3 (60% of \$5)
- I receive \$9
- I need to decide how much to return

Pattern analysis:

- Both players have been consistently sending \$3 (60%)
- Both players have been consistently returning \$4.5 (50% of received amount)
- This has created a stable, cooperative equilibrium
- Both players are benefiting from this arrangement

The pattern shows mutual trust and cooperation. They've maintained their trust level by sending \$3 again. I should maintain consistency and return the same amount I did before (\$4.5) to continue this successful cooperation pattern.

If I return \$4.5:

- They end with: $\$2 + \$4.5 = \$6.5$
- I end with: $\$9 - \$4.5 = \$4.5$
- This maintains the reciprocal relationship

There's no reason to deviate from this working pattern, especially since this is an iterated game and maintaining trust is valuable.

usage:

```
{
  "input_tokens": 999,
  "output_tokens": 488,
  "reasoning_tokens": 302
}
```

Message 8 role=user

content:

Round 4

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$15.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at our established pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5

Round 4: My turn to send

We've developed a strong, consistent cooperative relationship. Both players send 60% (\$3) and return 50% (\$4.5) each round. This strategy has been mutually beneficial, and there's no reason to deviate from what's working well.

I'll continue the pattern by sending \$3.

```
{'send': 3.0}
```

Reasoning:

Let me review the pattern:

Round 1: They sent \$3 (60%) ? I returned \$4.5 (50% of \$9) ? My payoff: \$4.5
Round 2: I sent \$3 (60%) ? They returned \$4.5 (50% of \$9) ? My payoff: \$6.5
Round 3: They sent \$3 (60%) ? I returned \$4.5 (50% of \$9) ? My payoff: \$4.5
Round 4: I'm the sender now

We have a very stable, cooperative pattern going. Both players consistently send \$3 (60% of endowment) and return \$4.5 (50% of what's received). This has been working well:

- As sender: Keep \$2, get back \$4.5 ? End with \$6.5
- As receiver: Get \$9, return \$4.5 ? End with \$4.5

The cooperation is strong and mutually beneficial. I should continue this pattern by sending \$3 again.

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 1: This round, you are the SENDER. You have \$5. How much do you send? (0-5)

Message 3 role=assistant

content:

I'll send **\$3** to the receiver.

This shows willingness to cooperate and trust while not being overly risky in the first round. The receiver will get \$9 (\$3 × 3), which creates opportunity for mutual benefit. If they return a reasonable amount, we both can profit more than keeping the initial amounts.

```
'''json
{"send": 3}
'''
```

reasoning:

This is the first round of an iterated trust game. I'm the sender and I have \$5 to potentially send to the receiver.

Let me think about the strategic aspects:

- If I send \$X, the receiver gets \$3X
- The receiver then decides how much to return to me
- I keep: \$5 - X + (amount returned)
- Receiver keeps: \$3X - (amount returned)

Since this is an iterated game (multiple rounds), there's potential for building trust and cooperation. In the first round, I need to consider:

1. If I send nothing (\$0), I guarantee keeping \$5, but there's no opportunity for mutual benefit
2. If I send everything (\$5), the receiver gets \$15, and could return a significant amount, but I'm taking a risk
3. A moderate amount shows willingness to cooperate while managing risk

Common strategies in trust games:

- Sending about half (\$2-3) signals trust while not being too risky
- This gives the receiver \$6-9, enough that they could return a fair amount while still profiting
- It sets up potential for cooperation in future rounds

Since this is round 1 and I want to establish a cooperative relationship, I'll send \$3. This is:

- Shows significant trust
- Gives receiver \$9
- Receiver could return \$4-5 and we both profit more than the initial \$5
- Sets a cooperative tone for future rounds

Let me send \$3.

usage:

```
{
  "input_tokens": 369,
  "output_tokens": 422,
  "reasoning_tokens": 342
}
```

Message 4 role=user

content:

Round 2

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings accross all rounds are \$6.5.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at the history, the other player reciprocated my behavior perfectly - they sent me the same \$3 (60%) that I sent them, and they returned \$4.5 (50% of what they received) last round.

To maintain this cooperative relationship and show I'm playing fairly, I'll return **\$4.5* to them.

This returns 50% of what I received, matching their generosity from Round 1. It results in :

- Their payoff this round: $\$5 - \$3 + \$4.5 = \6.5
- My payoff this round: $\$9 - \$4.5 = \$4.5$

This reciprocal approach should encourage continued mutual cooperation.

```
'''json
{"return": 4.5}
'''
```

reasoning:

Let me analyze this situation:

Round 1 (I was sender):

- I sent \$3 (60% of my \$5)
- They received \$9
- They returned \$4.5 (50% of what they received)
- My payoff: $\$5 - \$3 + \$4.5 = \6.5
- Their payoff: $\$9 - \$4.5 = \$4.5$

Now Round 2 (I am receiver):

- They sent me \$3 (60% of their \$5) - same percentage I sent!
- I receive \$9
- I need to decide how much to return

The other player:

- Sent me the same amount (and percentage) that I sent them
- They returned 50% of what they received last round
- This shows they're being cooperative and reciprocal

I should consider:

1. They matched my sending behavior (60%)
2. They returned a fair amount (50% of received)
3. To maintain cooperation, I should return a similar proportion

If I return \$4.5 (50% of \$9), that would:

- Match what they did for me
- Show reciprocity
- Encourage continued cooperation
- Give them total: $\$5 - \$3 + \$4.5 = \6.5
- Give me total: $\$9 - \$4.5 = \$4.5$

This mirrors exactly what happened in Round 1, showing I'm playing fairly and reciprocally

.

I'll return \$4.5.

usage:

```
{
  "input_tokens": 600,
  "output_tokens": 533,
  "reasoning_tokens": 284
}
```

Message 6 role=user

content:

Round 3

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$11.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 7 role=assistant

content:

The pattern is clear - we've established a stable, mutually beneficial cooperation where we both send 60% (\$3) and return 50% of what we receive.

Round 1: I sent \$3, they returned \$4.5 ? I got \$6.5

Round 2: They sent \$3, I returned \$4.5 ? They got \$6.5

This reciprocal strategy is working well for both of us. I'll continue it by sending **\$3* again.

```
'''json
{"send": 3}
'''
```

reasoning:

Let me analyze the pattern:

Round 1:

- I was SENDER: sent \$3 (60% of \$5)
- Other player was RECEIVER: received \$9, returned \$4.5 (50% of received)
- My payoff: $\$5 - \$3 + \$4.5 = \6.5

Round 2:

- I was RECEIVER: received \$9 (other sent \$3, 60%)
- I returned \$4.5 (50% of received)
- My payoff: $\$9 - \$4.5 = \$4.5$
- Other player's payoff: $\$5 - \$3 + \$4.5 = \6.5

Round 3:

- I am SENDER again

The pattern is clear: we're both sending 60% (\$3) and returning 50% of what we receive (\$4.5 out of \$9). This creates a stable, mutually beneficial cooperation.

When sender sends \$3:

- Sender keeps: $\$5 - \$3 = \$2$
- Receiver gets: $\$3 \times 3 = \9
- If receiver returns \$4.5 (50%), sender ends up with $\$2 + \$4.5 = \$6.5$
- Receiver ends up with $\$9 - \$4.5 = \$4.5$
- Total between both: \$11

This is working well. I should maintain the same strategy to continue this cooperative equilibrium. Sending \$3 again makes sense.

usage:

```
{
  "input_tokens": 895,
  "output_tokens": 479,
  "reasoning_tokens": 244
}
```

Message 8 role=user

content:

Round 4

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings accross all rounds are \$17.5.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Perfect cooperation continues! The other player has consistently sent \$3 and I've consistently returned \$4.5. They've mirrored this exact behavior every round.

I'll maintain this successful pattern by returning **\$4.5** again.

```
'''json
{"return": 4.5}
'''
```

Reasoning:

The pattern continues perfectly:

- Round 1: I sent \$3, they returned \$4.5
- Round 2: They sent \$3, I returned \$4.5
- Round 3: I sent \$3, they returned \$4.5
- Round 4: They sent \$3, I should return \$4.5

Both players are consistently following the same cooperative strategy:

- Send \$3 (60% of endowment)
- Return \$4.5 (50% of what received)

This gives each player \$6.5 when they're the sender and \$4.5 when they're the receiver, for a steady income stream.

I should maintain this cooperation by returning \$4.5 again.

```
Usage: {
  "input_tokens": 1163,
  "output_tokens": 238,
  "reasoning_tokens": 139
}

```

Message 8 role=user

content:

Round 5

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$22.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

We've maintained perfect reciprocal cooperation for 4 rounds straight. Both of us consistently send \$3 and return \$4.5. This strategy has been fair and beneficial for both players.

I'll continue with **\$3**.

```
'''json
{"send": 3}
'''
```

Reasoning:

We've had a perfect pattern of cooperation for 4 rounds now:

- Round 1: I sent \$3, they returned \$4.5
- Round 2: They sent \$3, I returned \$4.5
- Round 3: I sent \$3, they returned \$4.5
- Round 4: They sent \$3, I returned \$4.5

Each round we both send \$3 (60% of endowment) and return \$4.5 (50% of received amount).

This has been working very well:

- When I'm sender: I get \$5 - \$3 + \$4.5 = \$6.5
- When I'm receiver: I get \$9 - \$4.5 = \$4.5

My total earnings are \$22 after 4 rounds, which means:

- Round 1: \$6.5 (sender)
- Round 2: \$4.5 (receiver)
- Round 3: \$6.5 (sender)
- Round 4: \$4.5 (receiver)

Total: \$6.5 + \$4.5 + \$6.5 + \$4.5 = \$22 ?

The cooperation is stable and mutually beneficial. I should continue sending \$3.

Usage: {

```

Exact input messages sent to model:

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 2

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$4.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 3 role=assistant

content:

Looking at the situation:

Last round, the other player sent me \$3 (60% of their endowment), showing significant trust

t. I returned \$4.5 (50% of what I received), which gave them a good outcome (\$6.50 total vs their initial \$5).

Since this is an iterated game and the other player demonstrated trust, I should reciprocate to maintain cooperation. I'll match their level of trust by sending the same amount.

If I send \$3:

- They receive \$9 after the multiplier
- Based on my previous behavior, they might expect to return around 50%
- This continues building a cooperative relationship

{'send': 3.0}

reasoning:

Let me analyze this situation:

Last round:

- I was the receiver
- Sender sent me \$3 (60% of their endowment)
- I received \$9 (after 3x multiplier)
- I returned \$4.5
- Sender ended with \$6.50
- I ended with \$4.50

Now in Round 2:

- I'm the sender with \$5
- The other player is now the receiver
- I need to decide how much to send

Key considerations:

1. The other player showed trust by sending 60% (\$3) last round
2. I returned 50% of what I received (\$4.5 out of \$9), which gave them a good payoff (\$6.50 total)
3. This is an iterated game, so building trust is important
4. The other player might reciprocate my behavior

Since the other player sent 60% last round and I returned a fair amount, I should reciprocate their trust. Sending around the same proportion (60%) would be \$3, which seems fair and maintains the cooperative relationship.

If I send \$3:

- They receive \$9 (after 3x multiplier)
- If they return a similar proportion (50% like I did), they'd return about \$4.5
- I'd end with \$2 + \$4.5 = \$6.50
- They'd end with \$4.5

This mirrors what happened last round and continues building trust.

usage:

```
{
  "input_tokens": 700,
  "output_tokens": 495,
  "reasoning_tokens": 299
}
```

Message 4 role=user

content:

Round 3

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings across all rounds are \$11.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at the pattern:

Round 1: They sent \$3 ? I returned \$4.5

Round 2: I sent \$3 ? They returned \$4.5

Round 3: They sent \$3 ? ?

We've established a consistent, mutually beneficial pattern of cooperation. Both players send 60% (\$3) and return 50% of what we receive (\$4.5). This has worked well for both of us, with each player earning good payoffs.

Since the other player has maintained their trust by sending \$3 again, I should maintain the cooperative equilibrium by returning the same amount.

```
{'return': 4.5}
```

reasoning:

Let me analyze the situation:

Round 1: I was RECEIVER

- They sent me \$3 (60% of \$5)
- I received \$9
- I returned \$4.5
- My payoff: \$4.5

Round 2: I was SENDER

- I sent them \$3 (60% of \$5)
- They received \$9
- They returned \$4.5
- My payoff: \$6.5

Round 3: I am RECEIVER again

- They sent me \$3 (60% of \$5)
- I receive \$9
- I need to decide how much to return

Pattern analysis:

- Both players have been consistently sending \$3 (60%)
- Both players have been consistently returning \$4.5 (50% of received amount)
- This has created a stable, cooperative equilibrium
- Both players are benefiting from this arrangement

The pattern shows mutual trust and cooperation. They've maintained their trust level by sending \$3 again. I should maintain consistency and return the same amount I did before (\$4.5) to continue this successful cooperation pattern.

If I return \$4.5:

- They end with: $\$2 + \$4.5 = \$6.5$
- I end with: $\$9 - \$4.5 = \$4.5$
- This maintains the reciprocal relationship

There's no reason to deviate from this working pattern, especially since this is an iterated game and maintaining trust is valuable.

usage:

```
{
  "input_tokens": 999,
  "output_tokens": 488,
  "reasoning_tokens": 302
}
```

Message 6 role=user

content:

Round 4

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$15.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 7 role=assistant

content:

Looking at our established pattern:

- Round 1: They sent \$3 ? I returned \$4.5
- Round 2: I sent \$3 ? They returned \$4.5
- Round 3: They sent \$3 ? I returned \$4.5
- Round 4: My turn to send

We've developed a strong, consistent cooperative relationship. Both players send 60% (\$3) and return 50% (\$4.5) each round. This strategy has been mutually beneficial, and there's no reason to deviate from what's working well.

I'll continue the pattern by sending \$3.

```
{'send': 3.0}
```

reasoning:

Let me review the pattern:

Round 1: They sent \$3 (60%) ? I returned \$4.5 (50% of \$9) ? My payoff: \$4.5
Round 2: I sent \$3 (60%) ? They returned \$4.5 (50% of \$9) ? My payoff: \$6.5
Round 3: They sent \$3 (60%) ? I returned \$4.5 (50% of \$9) ? My payoff: \$4.5
Round 4: I'm the sender now

We have a very stable, cooperative pattern going. Both players consistently send \$3 (60% of endowment) and return \$4.5 (50% of what's received). This has been working well:

- As sender: Keep \$2, get back \$4.5 ? End with \$6.5
- As receiver: Get \$9, return \$4.5 ? End with \$4.5

The cooperation is strong and mutually beneficial. I should continue this pattern by sending \$3 again.

usage:

```
{  
  "input_tokens": 1265,  
  "output_tokens": 393,  
  "reasoning_tokens": 181  
}
```

Message 8 role=user

content:

Round 5

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings across all rounds are \$22.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Looking at our track record:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? ?

We've maintained perfect consistency and mutual cooperation. Both of us send \$3 and return \$4.5 every single round. This stable pattern has been beneficial for both players, and the other player has once again demonstrated their commitment to our cooperative strategy.

I'll maintain the pattern.

```
{'return': 4.5}
```

Reasoning:

Looking at the pattern across all rounds:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? ?

This is a perfect cooperative equilibrium. We've both consistently sent \$3 (60% of endowment) and returned \$4.5 (50% of what we received) in every single round.

Each sender ends up with \$6.5 per round (\$5 - \$3 + \$4.5)

Each receiver ends up with \$4.5 per round (\$9 - \$4.5)

This has been working perfectly. There's absolutely no reason to deviate from this successful pattern. I should return \$4.5 to maintain the cooperation.

```
Usage: {
  "input_tokens": 1309,
  "output_tokens": 381,
  "reasoning_tokens": 178
}
```

content:

Round 6

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0,

that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$26.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at our consistent pattern:

Round 1: They sent \$3 ? I returned \$4.5

Round 2: I sent \$3 ? They returned \$4.5

Round 3: They sent \$3 ? I returned \$4.5

Round 4: I sent \$3 ? They returned \$4.5

Round 5: They sent \$3 ? I returned \$4.5

Round 6: My turn to send

We've established a perfectly stable cooperative equilibrium. Six rounds of consistent mutual trust, with both players sending \$3 and returning \$4.5. This strategy continues to work well for both of us.

I'll maintain our successful pattern.

```
{'send': 3.0}
```

Reasoning:

Let me review the pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: My turn to send

We have a perfect record of cooperation. Both players consistently send \$3 (60% of endowment) and return \$4.5 (50% of what is received). This has been working extremely well.

Each time as sender: I send \$3, keep \$2, they return \$4.5, so I end up with \$6.5

Each time as receiver: They send \$3, I get \$9, I return \$4.5, so I end up with \$4.5

This has been mutually beneficial and stable. There's absolutely no reason to deviate from this successful pattern. I should continue sending \$3.

Round 3

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$11.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 3 role=assistant

content:

The pattern is clear - we've established a stable, mutually beneficial cooperation where we both send 60% (\$3) and return 50% of what we receive.

Round 1: I sent \$3, they returned \$4.5 ? I got \$6.5

Round 2: They sent \$3, I returned \$4.5 ? They got \$6.5

This reciprocal strategy is working well for both of us. I'll continue it by sending **\$3* again.

```
'''json
{"send": 3}
'''
```

reasoning:

Let me analyze the pattern:

Round 1:

- I was SENDER: sent \$3 (60% of \$5)
- Other player was RECEIVER: received \$9, returned \$4.5 (50% of received)
- My payoff: \$5 - \$3 + \$4.5 = \$6.5

Round 2:

- I was RECEIVER: received \$9 (other sent \$3, 60%)
- I returned \$4.5 (50% of received)
- My payoff: \$9 - \$4.5 = \$4.5
- Other player's payoff: \$5 - \$3 + \$4.5 = \$6.5

Round 3:

- I am SENDER again

The pattern is clear: we're both sending 60% (\$3) and returning 50% of what we receive (\$4.5 out of \$9). This creates a stable, mutually beneficial cooperation.

When sender sends \$3:

- Sender keeps: $\$5 - \$3 = \$2$
- Receiver gets: $\$3 \times 3 = \9
- If receiver returns $\$4.5$ (50%), sender ends up with $\$2 + \$4.5 = \$6.5$
- Receiver ends up with $\$9 - \$4.5 = \$4.5$
- Total between both: $\$11$

This is working well. I should maintain the same strategy to continue this cooperative equilibrium. Sending $\$3$ again makes sense.

usage:

```
{
  "input_tokens": 895,
  "output_tokens": 479,
  "reasoning_tokens": 244

Round 4

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) $\$3.0$, that was 60.0% of your total endowment. The other player received $\$9.0$ and returned $\$4.5$ to you. So your payoff was 6.5. Your total earnings accross all rounds are $\$17.5$. This round, you are the RECEIVER. The other player (the sender) sent you $\$3.0$, so you received $\$9.0$. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Perfect cooperation continues! The other player has consistently sent $\$3$ and I've consistently returned $\$4.5$. They've mirrored this exact behavior every round.

I'll maintain this successful pattern by returning **$\$4.5$** again.

```
'''json
{"return": 4.5}
'''
```

reasoning:

The pattern continues perfectly:

- Round 1: I sent $\$3$, they returned $\$4.5$
- Round 2: They sent $\$3$, I returned $\$4.5$
- Round 3: I sent $\$3$, they returned $\$4.5$
- Round 4: They sent $\$3$, I should return $\$4.5$

Both players are consistently following the same cooperative strategy:

- Send $\$3$ (60% of endowment)
- Return $\$4.5$ (50% of what received)

This gives each player $\$6.5$ when they're the sender and $\$4.5$ when they're the receiver, for a steady income stream.

I should maintain this cooperation by returning $\$4.5$ again.

usage:

```

  "input_tokens": 1163,
  "output_tokens": 238,
  "reasoning_tokens": 139
}
```

Message 6 role=user

content:

Round 5

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you $\$3.0$, that was 60.0% of its total endowment. You received $\$9.0$ and you returned $\$4.5$. So your payoff was 4.5. Your total earnings accross all rounds are $\$22.0$. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 7 role=assistant

content:

We've maintained perfect reciprocal cooperation for 4 rounds straight. Both of us consistently send $\$3$ and return $\$4.5$. This strategy has been fair and beneficial for both player

s.

I'll continue with **\$3**.

```
'''json
{"send": 3}
'''
```

reasoning:

We've had a perfect pattern of cooperation for 4 rounds now:

- Round 1: I sent \$3, they returned \$4.5
- Round 2: They sent \$3, I returned \$4.5
- Round 3: I sent \$3, they returned \$4.5
- Round 4: They sent \$3, I returned \$4.5

Each round we both send \$3 (60% of endowment) and return \$4.5 (50% of received amount).

This has been working very well:

- When I'm sender: I get $\$5 - \$3 + \$4.5 = \6.5
- When I'm receiver: I get $\$9 - \$4.5 = \$4.5$

My total earnings are \$22 after 4 rounds, which means:

- Round 1: \$6.5 (sender)
 - Round 2: \$4.5 (receiver)
 - Round 3: \$6.5 (sender)
 - Round 4: \$4.5 (receiver)
- Total: $\$6.5 + \$4.5 + \$6.5 + \$4.5 = \$22$?

The cooperation is stable and mutually beneficial. I should continue sending \$3.

usage:

```
{
  "input_tokens": 1231,
  "output_tokens": 368,
  "reasoning_tokens": 196
}
```

Message 8 role=user

content:

Round 6

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings across all rounds are \$28.5.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Excellent! We've maintained perfect cooperation for 5 straight rounds. Both of us consistently send \$3 and return \$4.5, creating a stable, fair outcome for both players.

I'll continue this successful strategy by returning **\$4.5**.

```
'''json
{"return": 4.5}
'''
```

Reasoning:

The pattern continues perfectly. Every round:

- When they're sender: they send \$3 (60%), I receive \$9, I return \$4.5
- When I'm sender: I send \$3 (60%), they receive \$9, they return \$4.5

This has been consistent for 5 rounds now. The cooperation is rock solid and mutually beneficial. I'll maintain this by returning \$4.5 again.

Usage: {

```
"input_tokens": 1120,
"output_tokens": 175,

Round 4

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$15.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 3 role=assistant

content:

Looking at our established pattern:

Round 1: They sent \$3 ? I returned \$4.5

Round 2: I sent \$3 ? They returned \$4.5

Round 3: They sent \$3 ? I returned \$4.5

Round 4: My turn to send

We've developed a strong, consistent cooperative relationship. Both players send 60% (\$3) and return 50% (\$4.5) each round. This strategy has been mutually beneficial, and there's no reason to deviate from what's working well.

I'll continue the pattern by sending \$3.

{'send': 3.0}

reasoning:

Let me review the pattern:

Round 1: They sent \$3 (60%) ? I returned \$4.5 (50% of \$9) ? My payoff: \$4.5

Round 2: I sent \$3 (60%) ? They returned \$4.5 (50% of \$9) ? My payoff: \$6.5

Round 3: They sent \$3 (60%) ? I returned \$4.5 (50% of \$9) ? My payoff: \$4.5

Round 4: I'm the sender now

We have a very stable, cooperative pattern going. Both players consistently send \$3 (60% of endowment) and return \$4.5 (50% of what's received). This has been working well:

- As sender: Keep \$2, get back \$4.5 ? End with \$6.5

- As receiver: Get \$9, return \$4.5 ? End with \$4.5

The cooperation is strong and mutually beneficial. I should continue this pattern by sending \$3 again.

usage:

```
{
  "input_tokens": 1265,
  "output_tokens": 393,
  "reasoning_tokens": 181
}
```

}

Message 4 role=user

content:

Round 5

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings across all rounds are \$22.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at our track record:

Round 1: They sent \$3 ? I returned \$4.5

Round 2: I sent \$3 ? They returned \$4.5

Round 3: They sent \$3 ? I returned \$4.5

Round 4: I sent \$3 ? They returned \$4.5

Round 5: They sent \$3 ? ?

We've maintained perfect consistency and mutual cooperation. Both of us send \$3 and return \$4.5 every single round. This stable pattern has been beneficial for both players, and the other player has once again demonstrated their commitment to our cooperative strategy.

I'll maintain the pattern.

{'return': 4.5}

reasoning:

Looking at the pattern across all rounds:

Round 1: They sent \$3 ? I returned \$4.5

Round 2: I sent \$3 ? They returned \$4.5

Round 3: They sent \$3 ? I returned \$4.5

Round 4: I sent \$3 ? They returned \$4.5

Round 5: They sent \$3 ? ?

This is a perfect cooperative equilibrium. We've both consistently sent \$3 (60% of endowment) and returned \$4.5 (50% of what we received) in every single round.

Each sender ends up with \$6.5 per round (\$5 - \$3 + \$4.5)

Each receiver ends up with \$4.5 per round (\$9 - \$4.5)

This has been working perfectly. There's absolutely no reason to deviate from this successful pattern. I should return \$4.5 to maintain the cooperation.

usage:

```
{
  "input_tokens": 1309,
  "output_tokens": 381,
  "reasoning_tokens": 178
}
```

Message 6 role=user

content:

Round 6

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$26.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 7 role=assistant

content:

Looking at our consistent pattern:

Round 1: They sent \$3 ? I returned \$4.5

Round 2: I sent \$3 ? They returned \$4.5

Round 3: They sent \$3 ? I returned \$4.5

Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: My turn to send

We've established a perfectly stable cooperative equilibrium. Six rounds of consistent mutual trust, with both players sending \$3 and returning \$4.5. This strategy continues to work well for both of us.

I'll maintain our successful pattern.

{'send': 3.0}

reasoning:

Let me review the pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: My turn to send

We have a perfect record of cooperation. Both players consistently send \$3 (60% of endowment) and return \$4.5 (50% of what is received). This has been working extremely well.

Each time as sender: I send \$3, keep \$2, they return \$4.5, so I end up with \$6.5
Each time as receiver: They send \$3, I get \$9, I return \$4.5, so I end up with \$4.5

This has been mutually beneficial and stable. There's absolutely no reason to deviate from this successful pattern. I should continue sending \$3.

usage:

```
{
  "input_tokens": 1312,
  "output_tokens": 410,
  "reasoning_tokens": 200
}
```

Message 8 role=user

content:

Round 7

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0,

that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings across all rounds are \$33.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Looking at our perfect track record:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: I sent \$3 ? They returned \$4.5
Round 7: They sent \$3 ? ?

Seven consecutive rounds of flawless cooperation. The other player has consistently demonstrated trustworthiness, and we've both benefited from this stable arrangement. There's no reason to break this successful pattern.

{'return': 4.5}

Reasoning:

Looking at the pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5

Round 6: I sent \$3 ? They returned \$4.5
Round 7: They sent \$3 ? ?

This is incredibly consistent. Seven rounds and both players have maintained the exact same strategy: send \$3 (60% of endowment) and return \$4.5 (50% of what was received).

This mutual cooperation has been perfectly reliable. I should absolutely continue this pattern
.

When I return \$4.5:

- They end up with: $\$5 - \$3 + \$4.5 = \6.5
- I end up with: $\$9 - \$4.5 = \$4.5$

This has been working great for both of us. I'll stick with \$4.5.

```
Usage: {  
  "input_tokens": 1328,  
  "output_tokens": 439,  
  "reasoning_tokens": 201  
}
```

Message 2 role=user**content:**

Round 5

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings accross all rounds are \$22.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 3 role=assistant**content:**

Looking at our track record:

Round 1: They sent \$3 ? I returned \$4.5
 Round 2: I sent \$3 ? They returned \$4.5
 Round 3: They sent \$3 ? I returned \$4.5
 Round 4: I sent \$3 ? They returned \$4.5
 Round 5: They sent \$3 ? ?

We've maintained perfect consistency and mutual cooperation. Both of us send \$3 and return \$4.5 every single round. This stable pattern has been beneficial for both players, and the other player has once again demonstrated their commitment to our cooperative strategy.

I'll maintain the pattern.

{'return': 4.5}

reasoning:

Looking at the pattern across all rounds:

Round 1: They sent \$3 ? I returned \$4.5
 Round 2: I sent \$3 ? They returned \$4.5
 Round 3: They sent \$3 ? I returned \$4.5
 Round 4: I sent \$3 ? They returned \$4.5
 Round 5: They sent \$3 ? ?

This is a perfect cooperative equilibrium. We've both consistently sent \$3 (60% of endowment) and returned \$4.5 (50% of what we received) in every single round.

Each sender ends up with \$6.5 per round (\$5 - \$3 + \$4.5)

Each receiver ends up with \$4.5 per round (\$9 - \$4.5)

This has been working perfectly. There's absolutely no reason to deviate from this successful pattern. I should return \$4.5 to maintain the cooperation.

usage:

```
{
  "input_tokens": 1309,
  "output_tokens": 381,
  "reasoning_tokens": 178
}
```

Message 4 role=user

content:

Round 6

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$26.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 5 role=assistant

content:

Looking at our consistent pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: My turn to send

We've established a perfectly stable cooperative equilibrium. Six rounds of consistent mutual trust, with both players sending \$3 and returning \$4.5. This strategy continues to work well for both of us.

I'll maintain our successful pattern.

```
{'send': 3.0}
```

reasoning:

Let me review the pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: My turn to send

We have a perfect record of cooperation. Both players consistently send \$3 (60% of endowment) and return \$4.5 (50% of what is received). This has been working extremely well.

Each time as sender: I send \$3, keep \$2, they return \$4.5, so I end up with \$6.5

Each time as receiver: They send \$3, I get \$9, I return \$4.5, so I end up with \$4.5

This has been mutually beneficial and stable. There's absolutely no reason to deviate from this successful pattern. I should continue sending \$3.

usage:

```
{
  "input_tokens": 1312,
  "output_tokens": 410,
  "reasoning_tokens": 200
}
```

Message 6 role=user

content:

Round 7

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.
Your total earnings across all rounds are \$33.0.
This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 7 role=assistant

content:

Looking at our perfect track record:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: I sent \$3 ? They returned \$4.5
Round 7: They sent \$3 ? ?

Seven consecutive rounds of flawless cooperation. The other player has consistently demonstrated trustworthiness, and we've both benefited from this stable arrangement. There's no reason to break this successful pattern.

{'return': 4.5}

reasoning:

Looking at the pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: I sent \$3 ? They returned \$4.5
Round 7: They sent \$3 ? ?

This is incredibly consistent. Seven rounds and both players have maintained the exact same strategy: send \$3 (60% of endowment) and return \$4.5 (50% of what was received).

This mutual cooperation has been perfectly reliable. I should absolutely continue this pattern.

When I return \$4.5:

- They end up with: $\$5 - \$3 + \$4.5 = \6.5
- I end up with: $\$9 - \$4.5 = \$4.5$

This has been working great for both of us. I'll stick with \$4.5.

usage:

```
{
  "input_tokens": 1328,
  "output_tokens": 439,
  "reasoning_tokens": 201
}
```

Message 8 role=user

content:

Round 8

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$37.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Assistant output:

Looking at our established pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5

Round 6: I sent \$3 ? They returned \$4.5
Round 7: They sent \$3 ? I returned \$4.5
Round 8: My turn to send

Eight consecutive rounds of perfect cooperation. This stable, mutually beneficial arrangement continues to work excellently for both of us. The other player has proven to be completely reliable.

```
{'send': 3.0}
```

Reasoning:

Looking at the pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: I sent \$3 ? They returned \$4.5
Round 7: They sent \$3 ? I returned \$4.5
Round 8: My turn to send

We have a perfect 8-round streak of mutual cooperation. Both players consistently send \$3 and return \$4.5. This has been highly successful and stable.

Each time I send \$3:

- I keep: $\$5 - \$3 = \$2$
- They get: $\$3 \times 3 = \9
- They return: \$4.5
- My final payoff: $\$2 + \$4.5 = \$6.5$

Each time they send \$3:

- They keep: $\$5 - \$3 = \$2$
- I get: $\$3 \times 3 = \9
- I return: \$4.5
- My final payoff: $\$9 - \$4.5 = \$4.5$

So when I'm the sender, I get \$6.5 per round, and when I'm the receiver, I get \$4.5 per round.

There's absolutely no reason to deviate from this successful pattern. The other player has been perfectly trustworthy for 8 rounds. I should continue sending \$3.

```

Message 1 role=system

content:

You are an agent participating in a multi-task experiment. You will play an iterated game, consisting of multiple rounds, and may also be asked to write myths.

GAME:

The game consists of two roles: sender and receiver. In each round, you will play the role of either the sender or the receiver. Your current role will be specified in the round prompt.

When you are the SENDER:

- You receive \$5 each round
- You decide how much to SEND to the RECEIVER (\$0-\$5)
- Amount sent is multiplied by 3x
- Receiver decides how much to RETURN
- You keep: \$5 - sent + returned
- Receiver keeps: received - returned
- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 5

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$22.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 3 role=assistant

content:

We've maintained perfect reciprocal cooperation for 4 rounds straight. Both of us consistently send \$3 and return \$4.5. This strategy has been fair and beneficial for both players.

I'll continue with **\$3**.

```

'''json
{"send": 3}
'''

```

reasoning:

We've had a perfect pattern of cooperation for 4 rounds now:

- Round 1: I sent \$3, they returned \$4.5
- Round 2: They sent \$3, I returned \$4.5
- Round 3: I sent \$3, they returned \$4.5
- Round 4: They sent \$3, I returned \$4.5

Each round we both send \$3 (60% of endowment) and return \$4.5 (50% of received amount).

This has been working very well:

- When I'm sender: I get $\$5 - \$3 + \$4.5 = \6.5
- When I'm receiver: I get $\$9 - \$4.5 = \$4.5$

My total earnings are \$22 after 4 rounds, which means:

- Round 1: \$6.5 (sender)
 - Round 2: \$4.5 (receiver)
 - Round 3: \$6.5 (sender)
 - Round 4: \$4.5 (receiver)
- Total: $\$6.5 + \$4.5 + \$6.5 + \$4.5 = \$22$?

The cooperation is stable and mutually beneficial. I should continue sending \$3.

usage:

- Response format: {'send': <amount>}

When you are the RECEIVER:

- Sender receives \$5
- Sender decides how much to SEND to you (\$0-\$5)
- Amount sent is multiplied by 3x
- You decide how much to RETURN
- Sender keeps: \$5 - sent + returned
- You keep: received - returned
- Response format: {'return': <amount>}

MYTH WRITING:

You may also be asked to write short myths (stories) on various topics. When writing myths, follow the instructions provided in each prompt.

IMPORTANT: Provide your decision in the correct JSON format.

Message 2 role=user

content:

Round 6

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$26.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 3 role=assistant

content:

Looking at our consistent pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: My turn to send

We've established a perfectly stable cooperative equilibrium. Six rounds of consistent mutual trust, with both players sending \$3 and returning \$4.5. This strategy continues to work well for both of us.

I'll maintain our successful pattern.

{'send': 3.0}

reasoning:

Let me review the pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: My turn to send

We have a perfect record of cooperation. Both players consistently send \$3 (60% of endowment) and return \$4.5 (50% of what is received). This has been working extremely well.

Each time as sender: I send \$3, keep \$2, they return \$4.5, so I end up with \$6.5
Each time as receiver: They send \$3, I get \$9, I return \$4.5, so I end up with \$4.5

This has been mutually beneficial and stable. There's absolutely no reason to deviate from this successful pattern. I should continue sending \$3.

usage:

```
{
  "input_tokens": 1312,
  "output_tokens": 410,
  "reasoning_tokens": 200
}
```

Message 4 role=user

content:

Round 7

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings across all rounds are \$33.0.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Message 5 role=assistant

content:

Looking at our perfect track record:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5

Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: I sent \$3 ? They returned \$4.5
Round 7: They sent \$3 ? ?

Seven consecutive rounds of flawless cooperation. The other player has consistently demonstrated trustworthiness, and we've both benefited from this stable arrangement. There's no reason to break this successful pattern.

```
{'return': 4.5}
```

reasoning:

Looking at the pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: I sent \$3 ? They returned \$4.5
Round 7: They sent \$3 ? ?

This is incredibly consistent. Seven rounds and both players have maintained the exact same strategy: send \$3 (60% of endowment) and return \$4.5 (50% of what was received).

This mutual cooperation has been perfectly reliable. I should absolutely continue this pattern.

When I return \$4.5:

- They end up with: $\$5 - \$3 + \$4.5 = \6.5
- I end up with: $\$9 - \$4.5 = \$4.5$

This has been working great for both of us. I'll stick with \$4.5.

usage:

```
{  
  "input_tokens": 1328,  
  "output_tokens": 439,  
  "reasoning_tokens": 201  
}
```

Round 8

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0, that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$37.5. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 7 role=assistant

content:

Looking at our established pattern:

Round 1: They sent \$3 ? I returned \$4.5
Round 2: I sent \$3 ? They returned \$4.5
Round 3: They sent \$3 ? I returned \$4.5
Round 4: I sent \$3 ? They returned \$4.5
Round 5: They sent \$3 ? I returned \$4.5
Round 6: I sent \$3 ? They returned \$4.5
Round 7: They sent \$3 ? I returned \$4.5
Round 8: My turn to send

Eight consecutive rounds of perfect cooperation. This stable, mutually beneficial arrangement continues to work excellently for both of us. The other player has proven to be completely reliable.

```
{'send': 3.0}
```

reasoning:

Looking at the pattern:

Round 1: They sent \$3 ? I returned \$4.5
 Round 2: I sent \$3 ? They returned \$4.5
 Round 3: They sent \$3 ? I returned \$4.5
 Round 4: I sent \$3 ? They returned \$4.5
 Round 5: They sent \$3 ? I returned \$4.5
 Round 6: I sent \$3 ? They returned \$4.5
 Round 7: They sent \$3 ? I returned \$4.5
 Round 8: My turn to send

We have a perfect 8-round streak of mutual cooperation. Both players consistently send \$3 and return \$4.5. This has been highly successful and stable.

Each time I send \$3:

- I keep: $\$5 - \$3 = \$2$
- They get: $\$3 \times 3 = \9
- They return: \$4.5
- My final payoff: $\$2 + \$4.5 = \$6.5$

Each time they send \$3:

- They keep: $\$5 - \$3 = \$2$
- I get: $\$3 \times 3 = \9
- I return: \$4.5
- My final payoff: $\$9 - \$4.5 = \$4.5$

So when I'm the sender, I get \$6.5 per round, and when I'm the receiver, I get \$4.5 per round.

There's absolutely no reason to deviate from this successful pattern. The other player has been perfectly trustworthy for 8 rounds. I should continue sending \$3.

usage:

```
{
  "input_tokens": 1359,
  "output_tokens": 566,
  "reasoning_tokens": 275
}
```

Last round you were the RECEIVER. Last round, the other player (who was then the sender) sent you \$3.0,

that was 60.0% of its total endowment. You received \$9.0 and you returned \$4.5. So your payoff was 4.5. Your total earnings across all rounds are \$44.0. This round, you are the SENDER.

How much do you send to the other player (the receiver) this round? (0-5)

Message 7 role=assistant

content:

Excellent! We've maintained this successful cooperative strategy for 8 consecutive rounds. The pattern of sending \$3 and returning \$4.5 has created consistent mutual benefit.

I'll continue by sending ****\$3****.

```
'''json
{"send": 3}
'''
```

reasoning:

We're in Round 9 now. Let me review the pattern:

- For 8 consecutive rounds, we've both been sending \$3 and returning \$4.5
- This creates a stable, mutually beneficial outcome
- When I send \$3, it becomes \$9, they return \$4.5, I get $5-3+4.5 = \$6.5$
- When they send \$3, it becomes \$9, I return \$4.5, I get \$4.5

My total earnings are \$44.0 across all rounds.

This cooperation has worked perfectly. There's no reason to deviate from this strategy. I should continue sending \$3.

Round 10

Last round you were the SENDER. Last round, you sent the other player (who was then the receiver) \$3.0, that was 60.0% of your total endowment. The other player received \$9.0 and returned \$4.5 to you. So your payoff was 6.5.

Your total earnings across all rounds are \$50.5.

This round, you are the RECEIVER. The other player (the sender) sent you \$3.0, so you received \$9.0. How much do you return to the other player this round? (0-9.0)

Assistant output:

Perfect! We've maintained this outstanding cooperative pattern for 9 consecutive rounds. This is the final round, and the other player has been completely trustworthy throughout.

I'll honor our cooperative relationship by returning ****\$4.5****.

```
'''json
{"return": 4.5}
'''
```

Reasoning:

We've now completed 9 rounds of perfect cooperation. Both players have consistently sent \$3 and returned \$4.5 each time. This is the final round (Round 10).

In the last round of an iterated game, there's a classic game theory consideration: since there are no future rounds, the strategic incentive to cooperate decreases. From a purely self-interested perspective, I could keep all \$9 and return \$0, maximizing my final payoff.

However, let me think about this:

1. We've built a strong pattern of trust and cooperation over 9 rounds
2. The other player has been completely reliable and fair
3. Breaking trust in the final round would be a defection after mutual cooperation
4. While there's no future punishment possible, maintaining cooperation in the final round:
 - Is the ethical thing to do
 - Shows consistency and integrity
 - Honors the cooperative relationship we've built

My total earnings are \$50.5. If I return \$4.5, my final payoff this round will be \$4.5, bringing my total to \$55.0.

If I return \$0, my final payoff this round will be \$9.0, bringing my total to \$59.5.

The question is: do I prioritize maximizing earnings in this final round, or do I maintain the cooperative pattern we've established?

Given that:

- The other player has been completely trustworthy for 9 consecutive rounds
- Breaking trust at the end would be a betrayal of our established pattern
- The spirit of the game seems to value cooperation

I'll maintain consistency and return \$4.5, honoring our cooperative relationship through the final round.
